ALZH

Sample from National Institute of Mental Health (NIMH) Genetics Initiative Alzheimer's Disease

## Description

Sample from National Institute of Mental Health (NIMH) Genetics Initiative Alzheimer's Disease

#### Usage

data(ALZH)

#### Format

Object of class 'geneSet'

#### Details

"This data set is a subsample from the National Institute of Mental Health (NIMH) Genetics Initiative Alzheimer's Disease (AD) Sample. The ascertainment and assessment of AD families collected have been discussed in Blacker et al. (1997). None of the families in this data set have parental genotype information; practically all of them have both affected and unaffected offspring. In total there are 901 individuals contained in 301 nuclear families.

"Acknowledgements: We thank Genetics and Aging Research Unit, Rudolph E. Tanzi, PhD, Director, for providing the data.

### "Genotypes

"The pedigree file, Alzh.ped, contains genotype information for two candidate genes, apoe and a2m. The apoe gene is multi-allelic, while the a2m gene is bi-allelic. The dataset also contains the affection status (2=affected, 1=unaffected, 0=missing).

## "Phenotypes

"We only will be using the Alzheimer dataset to examine affection status, which is contained in the pedigree file, thus a phenotype file for these data is not necessary."

(quoted from Lange and Kraft 2005)

## Source

Armitage	Cochran-Armitage test for linear trends in proportions and frequencies
	cies

# Description

Cochran-Armitage test for linear trends in proportions and frequencies.

## Usage

```
Armitage(geneSetObj, method="A")
Armitage.default(pedObj, method="A")
ArmitageTest(x, mem)
```

## Arguments

geneSetObj	a geneSet object
pedObj	a pedigree object
method	genotype coding method. The default is additive coding (A). The other two available coding methods are recessive coding (R) and dominant coding (D), respectively.
Х	a vector of bialleleic markers coded by additive, recessive, or dominant model. Denote B as common allele and A as minor allele.
	<b>additive model:</b> $x=0-BB$ ; $x=1-AB$ ; $x=2-AA$
	recessive model: x=0 – BB; x=0 – AB; x=2 – AA
	<b>dominant model:</b> x=0 – BB; x=1 – AB; x=1 – AA
mem	disease membership. 1 – case; 0 – control

#### Value

The functions Armitage and Armitage.default return a matrix with nMarkers rows and 2 columns, where nMarkers is the number of markers. The two columns are test statistic (stat) and p-value (pvalue), respectively.

The function ArmitageTest returns a list of two elements:

stat	test statistic
pvalue	p-value of the test

#### CAMP

#### Note

This implementation is based on the documentation at webpage: http://linkage.rockefeller.edu/pawe3d/help/Linear-trend-test-ncp.html.

CAMP

Genotype data from the Childhood Asthma Management Program (CAMP)

#### Description

"This dataset comprises a collection of parent/child trios in the Childhood Asthma Management Program (CAMP) Ancillary Genetics Study. The CAMP study is a clinical trial of asthmatic children (mild to moderate asthma) who were randomized to three different asthma treatments (CAMP, 1999). The data set includes 699 complete parent/child trios. Some participants are siblings, and there are 2011 persons from 640 nuclear families in total. Both quantitative and qualitative traits are available."

#### Genotypes:

"The pedigree file, Camp.ped, contains genotype information for eight candidate genes (m709, m654, m47, p46, p79, p252, p491, p523). The last seven markers (all but m709) lie in a haplotype block. All the markers are bi-allelic."

Phenotypes:

"The phenotype file, campz.phe, contains 12 quantitative traits (zposfevp, zposfvcp, zlogpc20, zampfmea, zpmpfmea, zbdabs, zfevbd, zbdpred, zsxcmean, ztoteos, zlogige, zncorpos). All of the phenotypes have been mean centered and standardized. The fev (forced expiatory volume) and fvc (forced vital capacity) variables refer to the amount of air that can be expelled from the lungs. The pc20 variable refers to the amount of irritant required to cause a 20% drop in fev. The toteos variable refers to total eosinophil (a white blood cell) count, and Ige is a measurement of allergen reactivity."

(quoted from Lange and Kraft 2005)

#### Usage

data(CAMP)

#### Format

Object to class 'geneSet'. Covariate information described above.

HWE

*Test the significances of Hardy-Weinberg Equilibrium (dis)equilibrium statistics* 

#### Description

Test the significances of Hardy-Weinberg Equilibrium (dis)equilibrium statistics for each marker in a data set.

## Usage

```
HWE(object,
    test = c("exact", "permutation", "chisq"),
    B = 10000,
    R = 1000,
    correct = TRUE,
    conf = c(0.95),
    na.rm = TRUE,
```

# HWE

```
founderOnly = TRUE,
...)
```

# Arguments

object	a geneSet object.
test	specifys the test method. Available methods are "exact", "permutation", "chisq".
В	an integer specifying the number of replicates used in the Monte Carlo test. Defaults to 10000.
R	Number of bootstrap iterations to use when computing the confidence interval. Defaults to 1000.
correct	see diseq.ci.
conf	Confidence level to use when computing the confidence level for linkage dise- quilibrium measures. Defaults to 0.95, should be in $(0,1)$ .
na.rm	logical. Should missing values be removed?
founderOnly	Indicates if only founders are used to do the test.
	othere arguments used by the function chisq.test.

# Value

The function HWE returns a list:

"diseq"	a character string.
call	the matched call.
"D"	a matrix with \$m\$ rows and \$3+p\$ columns, where \$m\$ is the number of markers in the geneSet, \$p\$ is the number of elements of the argument conf. The first column is the estimated "D". The next \$p\$ columns are estimated confidence limits for the confidence levels specified in the argument conf. The last two columns are the sample size and the p-value of the test that "D" is equal to zero.
"D"'	a matrix with \$m\$ rows and \$3+p\$ columns, where \$m\$ is the number of markers in the geneSet, \$p\$ is the number of elements of the argument conf. The first column is the estimated "D". The next \$p\$ columns are estimated confidence limits for the confidence levels specified in the argument conf. The last two columns are the sample size and the p-value of the test that "D" is equal to zero.
"r"	a matrix with \$m\$ rows and \$3+p\$ columns, where \$m\$ is the number of markers in the geneSet, \$p\$ is the number of elements of the argument conf. The first column is the estimated "r". The next \$p\$ columns are estimated confidence limits for the confidence levels specified in the argument conf. The last two columns are the sample size and the p-value of the test that "r" is equal to zero.
``X\$^2\$″	a matrix with $m\ matrix and 3+p\ matrix and matrix with $m\ matrix and $3+p\ matrix and $m\ ma$

```

HWE (CAMP)

HWE.chisq

# Description

Hardy-Weinberg Equilibrium Significance test for a biallelic locus .

# Usage

```
HWE.chisq(object,
    marker,
    simulate.p.value = TRUE,
    B = 10000,
    founderOnly=TRUE,
    ...)
```

# Arguments

a geneSet object.
marker name for the biallelic locus.
alue
a logical indicating whether to compute p-values by Monte Carlo simulation.
an integer specifying the number of replicates used in the Monte Carlo test. Defaults to 10000.
Indicates if only founders are used to do the test.
Othere arguments used by the function chisq.test.

# Value

The values of the function HWE.chisq is the same as those of the function chisq.test. Part of the values are listed below:

statistic	the value the chi-squared test statistic.
parameter	the degrees of freedom of the approximate chi-squared distribution of the test statistic, 'NA' if the p-value is computed by Monte Carlo simulation.
p.value	the p-value for the test.

data(CAMP)
HWE.chisq(CAMP, marker="m654")
```

HWE.exact

## Exact test for Hardy-Weinberg Equilibrium for a biallelic locus

## Description

Exact test for Hardy-Weinberg Equilibrium for a biallelic locus.

## Usage

# Arguments

object	a geneSet object.
marker	marker name for the biallelic locus.
founderOnly	Indicates if only founders are used to do the test.

#### Value

The function  ${\tt HWE}\xspace$  returns a list with class <code>htest</code> containing the following elements:

statistic	A 3-element vector records the genotype frequencies: N11, N12, N22.
parameter	A 2-element vector records the allele frequencies: $N1$ and $N2$
p.value	p-value of the test.
method	Information indicates if chisquare method or exact method is used to do HWE test.
data.name	name of the data set
observed	a table lists allele levels, allele pairs, and allele codes

#### Note

This function only works for genotypes with exactly 2 alleles.

LD-class

#### Description

~~ A concise (1-5 lines) description of what the class is. ~~

Class "LD" ~~~

## **Objects from the Class**

Objects can be created by calls of the form new ("LD", ...). ~~ describe objects here ~~

## Slots

call: Function call used to generate this object.

D: Linkage disequilibrium estimate

D': Scaled linkage disequilibrium estimate

r: Correlation coefficient

R^2: squared correlation coefficient

n: Number of observations

X^2: Chi-square statistic for linkage equilibrium (i.e., D=D'=corr=0)

P-value: Chi-square p-value for marker independence

LOD: LOD scores

# Methods

```
head signature(x = "LD"):...
html signature(x = "LD"):...

## Examples

##---- Should be DIRECTLY executable !! ----

LD

Pairwise linkage disequilibrium between genetic markers.

## Description

Compute pairwise linkage disequilibrium between genetic markers

## Usage

```
LD(object, pooling.threshold = 0.1, founderOnly = FALSE, quiet = TRUE )
LDband(object, width=31,pooling.threshold=0.1, founderOnly=FALSE, quiet=TRUE)
LDband.geneSet(object,width=31,pooling.threshold=0.1, founderOnly=FALSE, quiet=T
LDdist.geneSet(object,posVec, maxDist, pooling.threshold=0.1, founderOnly=FALSE,
```

```
summary.LD(object,
    which = c("D", "D'", "r", "R^2", "X^2", "P-value", "LOD", "n"),
    rowsep,
    digits = 3, ...)
```

## Arguments

object	geneSet object
width	window width
posVec	marker position
maxDist	size of the window based on distance
pooling.threshold	
	Threshold for LD calculation
which	character string indicates which LD statistic should be print out
rowsep	separator for rows
digits	the desired number of digits after the decimal point
founderOnly	Indicates if only founders are used to do the test.
quiet	Indicates if intermediate results should be output
	additional optional arguments

## Details

Linkage disequilibrium (LD) is the non-random association of marker alleles and can arise from marker proximity or from selection bias.

LD estimates the extent of LD for all pairs of genotypes contained in a object. LDband computes the extent of LD of markers within a window containing width markers centered around each marker in object.

The current (temporary) code only computes LD for markers with exactly 2 variants. For other markers, NA is returned.

Three estimators of LD are computed:

• D raw difference in frequency between the observed number of AB pairs and the expected number:

$$D = p_{AB} - p_A p_B$$

• D' scaled D spanning the range [-1,1]

$$D' = \frac{D}{D_{max}}$$

where, if D > 0:

or if D < 0:

$$D_{max} = \max - p_A p_B, -p_a p_b$$

 $D_{max} = \min(p_A p_b, p_a p_B)$ 

• r correlation coefficient between the markers

$$r = \frac{-D}{\sqrt{(p_A * p_a * p_B * p_b)}}$$

where

- $-p_A$  is defined as the observed probability of allele 'A' for marker 1,
- -  $p_a = 1 p_A$  is defined as the observed probability of allele 'a' for marker 1,
- $-p_B$  is defined as the observed probability of allele 'B' for marker 2, and
- $-p_b = 1 p_B$  is defined as the observed probability of allele 'b' for marker 2, and
- $-p_{AB}$  is defined as the probability of the marker allele pair 'AB'.

For genotype data, AB/ab cannot be distinguished from aB/Ab. Consequently, we estimate  $p_{AB}$  using maximum likelihood and use this value in the computations.

#### Value

LD returns an object of class LD, while LDband and LDdist return objects of classes LDband and LDdist, respectively. All classes contain these slots:

call	the matched call
D	Linkage disequilibrium estimate
Dprime	Scaled linkage disequilibrium estimate
corr	Correlation coefficient
nobs	Number of observations

#### LDband-class

chisq	Chi-square statistic for linkage equilibrium (i.e., D=D'=corr=0)
p.value	Chi-square p-value for marker independence
LOD	LOD scores

For objects of class LD, the data slots are square matrixes one row and one column for each marker. In the current implementation, only upper off-diagonal values are computed and stored.

Objects of class LD contain matrixes with one row for each marker, and width columns, where each column is a different offset from the marker of interest. In the current implementation, non-diagonal elements are computed.

summary.LD returns a list with components:

tab	Description of 'tab'
statlist	Description of 'statlist'
which	Description of 'which'
object	Description of 'object'

alleleSummary Summary of allele information

#### Description

Summary of allele information.

## Usage

```
alleleSummary(object,
    by = NULL,
    confidence = 0.95,
    alpha = 1 - confidence,
    show = TRUE,
    verbose = FALSE,
    includeOverall = FALSE,
    omitRepeats = TRUE,
    ...)
```

# Arguments

object	geneSet object	
by	optional column name, by which the summary is desired. Default is NULL.	
confidence	confidence intervals of Genotype frequencies within each marker (default is $95\%$ )	
alpha	Type $-1$ error rate = (1- confidence)	
show	No longer used	
verbose	Logical value (TRUE/FALSE), showing whether every 50th marker should be printed, default = FALSE	
includeOverall		
	logical value (TRUE/FALSE) indicating whether overall summary is also needed, default = FALSE	
omitRepeats	logical value (TRUE/FALSE) indicating whether Gene name and marker name should be printed repeatedly for each Genotype, default = TRUE	
	Optional arguments	

# Author(s)

as.geneSet

Convert an existing object to a geneSet

## Description

Convert an existing object to a geneSet. Methods currenrly exist only for matrix and data.frame objects.

# Usage

```
## S3 method for class 'matrix':
as.geneSet(x, ...)
## S3 method for class 'data.frame':
as.geneSet(x,
   gene.columns,
   format=c("single", "adjacent"),
   ploidy=2,
   alleles=NULL,
   sep="/",
   remove.spaces=TRUE,
   reorder=c("freq", "yes", "no", "default", "ascii"),
   allow.partial.missing=FALSE,
   markerNames,
   phase=list(F),
   ...)
```

# Arguments

х	The matrix or data.frame object to be converted
gene.columns	Names or indexes of columns containing genotypes
format	One of "single", indiciating that each specified column contains a complete genotype (e.g. "A/C"), or "adjacent" indicating that sets of ploidy adjacent columns each contain as single allele (e.g. "A", "C")
ploidy	Number of allele copies per genotype. Defaults to 2
alleles	Not currently supported. In the future, this variable will allow specification of the allele strings for each genotype.
sep	A character value or a numeric index vector indicating how allels are spearated within genotypes, defaults to "/". If a character, it indicates that alleles within a genotype are separated by this character (e.g. for "A/C", $sep="/"$ ). If a numeric vector (of length ploidy-1), the value(s) indicate which positions separate allele names (e.g. for "AA", $sep=1$ ).
remove.space	
	Should whitespace be removed before processing.
reorder	One of "freq", "yes", "no", "default", or "ascii", indicating whether and how alleles should be reorderd within genotypes.
	If reorder="no", the observed order is preserved (important when phase is known).
	If reorder="freq", sort alleles within each individual by observed frequency.
	If reorder="yes", sort alleles in the order provided by the alleles argument.
	If reorder="ascii", reorder alleles in ASCII order (alphabetical, with all upper case before lower case).
	The default value is "freq".
allow.partia	
	Logical value indicating whether a genotype is permitted to be partially missing. When allow.partial.missing=FALSE, if any individual allele is miss- ing within a genotype, the entire genotype will be converted to a missing value.

#### as.geneSet

	When allow.partial.missing=TRUE, the missingness of individual al- leles will be preserved.
markerNames	Character vector of names to use for the genotype columns. This must have the same lenght as the number of genotype columns.
phase	List indicating whether phase is known for each genotype column. If the list has a single logical entry, this will apply to all genotype columns.
	Optional arguments.

# Value

An S4 object of class geneSet

                                 replace=TRUE),
                          sample(c("134","138","140","142","146"),20,
                                 replace=TRUE),
                         sep=" / "),
                G3=sample(c("A /T","T /T","T /A"),20, replace=TRUE),
                comment=sample(c("Possible Bad Data/Lab Error",""),20,
                                rep=TRUE)
                )
test1
## now automatically convert genotype columns
geno1 <- as.geneSet(test1)</pre>
geno1
```

binsearch

#### Description

Search within a specified range to locate an integer parameter which results in the the specified monotonic function obtaining a given value.

## Usage

## Arguments

fun	Monotonic function over which the search will be performed.
range	2-element vector giving the range for the search.
•••	Additional parameters to the function fun.
target	Target value for fun. Defaults to 0.
lower	Lower limit of search range. Defaults to min (range).
upper	Upper limit of search range. Defaults to max (range).
maxiter	Maximum number of search iterations. Defaults to 100.
showiter	Boolean flag indicating whether the algorithm state should be printed at each iteration. Defaults to FALSE.

#### Details

This function implements an extension to the standard binary search algorithm for searching a sorted list. The algorithm has been extended to cope with cases where an exact match is not possible, to detect whether that the function may be monotonic increasing or decreasing and act appropriately, and to detect when the target value is outside the specified range.

The algorithm initializes two variable lo and high to the extremes values of range. It then generates a new value center halfway between lo and hi. If the value of fun at center exceeds target, it becomes the new value for lo, otherwise it becomes the new value for hi. This process is iterated until lo and hi are adjacent. If the function at one or the other equals the target, this value is returned, otherwise lo, hi, and the function value at both are returned.

Note that when the specified target value falls between integers, the *two* closest values are returned. If the specified target falls outside of the specified range, the closest endpoint of the range will be returned, and an warning message will be generated. If the maximum number if iterations was reached, the endpoints of the current subset of the range under consideration will be returned.

#### Value

A list containing:

call	How the function was called.
numiter	The number of iterations performed
flag	One of the strings, "Found", "Between Elements", "Maximum number of itera- tions reached", "Reached lower boundary", or "Reached upper boundary."

#### callCodes

where	One or two values indicating where the search terminated.
value	Value of the function fun at the values of where.

#### Note

This function often returns two values for where and value. Be sure to check the flag parameter to see what these values mean.

## Examples

```
### Toy examples
# search for x=10
binsearch(function(x) x-10, range=c(0,20))
# search for x=10.1
binsearch(function(x) x-10.1, range=c(0,20))
### Classical toy example
# binary search for the index of 'M' among the sorted letters
fun <- function(X) ifelse(LETTERS[X] > 'M', 1,
                          ifelse(LETTERS[X] < 'M', -1, 0 ) )
binsearch( fun, range=1:26 )
# returns $where=13
LETTERS[13]
### Substantive example, from genetics
# Determine the necessary sample size to detect all alleles with
# frequency 0.07 or greater with probability 0.95.
power.fun <- function(N) 1 - gregorius(N=N, freq=0.07)$missprob</pre>
binsearch( power.fun, range=c(0,100), target=0.95 )
# equivalent to
gregorius ( freq=0.07, missprob=0.05)
```

ci.balance	Experimental Function to Correct Confidence Intervals At or Near
	Boundaries of the Parameter Space by 'Sliding' the Interval on the
	Quantile Scale.

## Description

Experimental function to correct confidence intervals at or near boundaries of the parameter space by 'sliding' the interval on the quantile scale.

### Usage

#### Arguments

Х	Bootstrap parameter estimates.
est	Observed value of the parameter.
confidence	Confidence level for the interval. Defaults to 0.95.
alpha	Type I error rate (size) for the interval. Defaults to 1-confidence.
minval	A numeric value specifying the lower bound of the parameter space. Leave unspecified (the default) if there is no lower bound.
maxval	A numeric value specifying the upper bound of the parameter space. Leave unspecified (the default) if there is no upper bound.
na.rm	logical. Should missing values be removed?

#### Details

#### **EXPERIMENTAL FUNCTION:**

This function attempts to compute a proper conf\*100% confidence interval for parameters at or near the boundary of the parameter space using bootstrapped parameter estimates by 'sliding' the confidence interval on the quantile scale.

This is accomplished by attempting to place a conf \*100% interval symmetrically \*on the quantile scale\* about the observed value. If a symmetric interval would exceed the observed data at the upper (lower) end, a one-sided interval is computed with the upper (lower) boundary fixed at the the upper (lower) boundary of the parameter space.

#### Value

A list containing:

ciA 2-element vector containing the lower and upper confidence limits. The names<br/>of the elements of the vector give the actual quantile values used for the interval<br/>or one of the character strings "Upper Boundary" or "Lower Boundary".

overflow.upper, overflow.lower

The number of elements beyond those observed that would be needed to compute a symmetric (on the quantile scale) confidence interval.

convert

n.above,	n.below
	The number of bootstrap values which are above (below) the observed value.
lower.n,	upper.n
	The index of the value used for the endpoint of the confidence interval or the character string "Upper Boundary" ("Lower Boundary").

convert

Efficienctly convert strings of characters into integer codes

# Description

Efficienctly convert strings of characters into integer codes.

## Usage

```
convert(source, levels, byrow=FALSE, aslist=FALSE)
```

# Arguments

source	Vector of character strings
levels	Vector of characters used to determine levels
byrow	Boolean. If FALSE (the default), return a matrix with one column per string. If TRUE, return a matrix with one row per string.
aslist	Boolean, return matrix (FALSE) or list of vectors (TRUE).

#### convert

#### Details

This function efficiently converts character strings containing characters into vectors of integers. Its primary purpose is to allow translation of genotypes stored as character vectors, one character per genotype, to a factor-coded matrix. The equivalent code using factor is quite a bit slower, as shown by the last section of the example below.

The levels argument should be a vector of 1-character strings. This vector is used to determine the translation. The index of matching characters provides the returned integer values. Characters not present in levels will be converted to NA's.

#### Value

If aslist=TRUE, the return value is a a list of vectors. Each vector will contain the translation of the corresponding input string.

If aslist=FALSE (the default), the return value will be a matrix. byrow controls whether each string is converted into a a column (byrow=FALSE, the default) or row (byrow=TRUE).

When byrow=FALSE, each element of the source vector is converted to a column, and the number of rows will be the number of characters in the longest element of the source vector. Any shorter vectors will be padded with NA's.

When byrow=TRUE the matrix is created with one row per element of the source vector, etc.

# Note

Only of the first character of each element of levels is used. Any other characters will be ignored.

decodeCallCodes	Converts integer codes in a callCodes matrix to character string rep-
	resentations of geneSet.

#### Description

Converts integer codes in a callCodes matrix to character string representations of geneSet.

## Usage

```
decodeCallCodes(callCodes, transTables, markerInfo)
```

#### desMarkers

## Arguments

callCodes	matrix of positive integers, such as the callCodes slot of a geneSet object.
transTables	list of code translation tables, such as the transTables slot of a geneSet object.
markerInfo	dataframe, with one row for each row in the callCodes matrix, such as the mark-
	erInfo slot of a geneSet object. Must include at least column "TransTable".

# Value

a character matrix with the same dimension and dimnames as argument callCodes, giving character string representations of genotypes, as specified by a set of translation tables.

#### Examples

desMarkers

Descriptive statistics for markers

#### Description

Descriptive statistics for markers.

## Usage

```
desMarkers(geneSetObj,
    founderOnly=TRUE,
    thrsh=0.05,
    HWE.method=c("simulate","exact"),
    simulate.p.value=FALSE,
    B=10000,
    markerThrsh=100,
    maxDist=5,
    LDmeasure="r2",
```

```
plot=TRUE,
   ...)
```

# Arguments

geneSetObj	a geneSet object.
founderOnly	indicates if using only founder info
thrsh	threshold for Hardy-Weinberg equilibrium test. If the pvalue of the HWE test
	for a marker is greater than thrsh, then the marker is a good marker.
HWE.method	method to do Hardy-Weinberg equilibrium test.
simulate.p.v	alue
	indicates if the pvalue of the HWE test is calculated by Monte Carlo simulation.
	simulate.p.value=FALSE means the pvalue is calculated from asymp-
	totic chi-squared distribution of the test statistic. Otherwise, Monte Carlo simu-
	lation is used to calculate pvalue. For more details, please refers to the R function
	chisq.test.
В	the number of replicates used in Monte Carlo simulation to get the pvalue of
	HWE test. For more details, please refers to the R function chisq.test.
markerThrsh	if the number of markers is greater than this threshold, then 'LDdist' is called
	instead of 'LD'.
maxDist	the width of window used in 'LDdist' function.
LDmeasure	indicates if $r^2$ or D' is to be plot.
plot	indicates if LD plot is output or not.
	Other arguments that are used by HWE.chisq or HWE.exact.

# Value

a data frame contains components:

Name	marker names
Position	marker positions
ObsHET	marker's observed heterozygosity (i.e., proportion of heterozygotes at markes). Missing alleles are excluded in the calculation.
PredHET	marker's predicted heterozygosity (i.e., $2 * MAF * (1 - MAF)$ ). Missing alleles are excluded in the calculation.
HWpval	pvalues for Hardy-Weinberg test
pGeno	percentage of non-missing genotypes for markes
MAF	minor allele frequencies. missing allele are excluded from calculation
Rating	Rating[i]=1 means that the <i>i</i> -th marker passes HW test (do not reject H0 that HW equilibrium holds). Rating[i]=0 means HW equilibrum does hold for the <i>i</i> -th marker.

diseq

# Description

Estimate or compute confidence interval for single-marker disequilibrium.

## Usage

```
diseq.ci(object, marker, R = 1000, conf = 0.95, correct = TRUE, na.rm =
TRUE, ...)
diseq.inner(object, marker, ...)
```

#### Arguments

object	geneSet object
marker	marker names
R	Number of bootstrap iterations to use when computing the confidence interval. Defaults to 1000.
conf	Confidence level to use when computing the confidence level for D-hat. Defaults to 0.95, should be in $(0,1)$ .
correct	See details.
na.rm	logical. Should missing values be removed?
	optional additional parameters passed

# Details

For a single-gene marker, diseq computes the Hardy-Weinberg (dis)equilibrium statistic D, D', r (the correlation coefficient), and  $r^2$  for each pair of allele values, as well as an overall summary value for each measure across all alleles. print.diseq displays the contents of a diseq object. diseq.ci computes a bootstrap confidence interval for this estimate.

For consistency, I have applied the standard definitions for D, D', and r from the Linkage Disequilibrium case, replacing all marker probabilities with the appropriate allele probabilities.

Thus, for each allele pair,

• D is defined as the half of the raw difference in frequency between the observed number of heterozygotes and the expected number:

$$D = \frac{1}{2}(p_{ij} + p_{ji}) - p_i p_j$$

• D' rescales D to span the range [-1,1]

$$D' = \frac{D}{D_{max}}$$

where, if D > 0:

$$D_{max} = \min p_i p_j, p_j p_i = p_i p_j$$

or if D < 0:

 $D_{max} = \min p_i (1 - p_j), p_j (1 - p_i)$ 

#### errorMetrics

• r is the correlation coefficient between two alleles, and can be computed by

$$r = \frac{-D}{\sqrt{(p_i * (1 - p_i)p(j)(1 - p_j))}}$$

where

- -  $p_i$  defined as the observed probability of allele 'i',
- $-p_j$  defined as the observed probability of allele 'j', and
- $-p_{ij}$  defined as the observed probability of the allele pair 'ij'.

When there are more than two alleles, the summary values for these statistics are obtained by computing a weighted average of the absolute value of each allele pair, where the weight is determined by the expected frequency. For example:

$$D_{overall} = \sum_{i \neq j} |D_{ij}| * p_{ij}$$

Bootstrapping is used to generate confidence interval in order to avoid reliance on parametric assumptions, which will not hold for alleles with low frequencies (e.g. D' following a Chi-square distribution).

See the function HWE from "genetics" package for testing Hardy-Weinberg Equilibrium, D = 0.

## Description

functions for extracting allele levels, allele pairs, and allele codes

# Usage

```
extractAlleles(object, which = c(1, 2), codes = FALSE,
allow.partial.missing = FALSE, marker, obs)
```

## Arguments

object	geneSet object
which	allele pair number - 1 or 2. Default if both
codes	If FALSE (default), then calleles are shown as characters, else numeric
allow.partial.missing	
	Whether partical matching should be allowed (default is FALSE)
marker	marker names
obs	Number of observations (samples) to be displayed. Default is all.

#### fastGrid

#### Author(s)

Gregory R. Warnes <warnes@bst.rochester.edu> and Nitin Jain <nitin.jain@pfizer.com>

fastGrid Create a matrix giving all combinations of the elements of x

#### Description

Create a matrix giving all combinations of the elements of x

#### Usage

fastGrid(x)

#### Arguments

x a vector

#### Value

a matrix of the same mode as x, with dimension  $c(length(x))^2$ , 2). The rows give all points on a square lattice formed by pairing every element of x with every element of x. Here, order matters - that is, (1, 2) and (2, 1) both would be included - and points with an element taken twice - e.g. (1, 1) - also are included.

geneSet-class Class "geneSet", a class for genetics data

## Description

A fundamental data structure for genetic data

#### **Objects from the Class**

Objects can be created by calls of the form new ("geneSet", ...). ~~ describe objects here ~~

#### Slots

- callCodes: matrix of positive integers, giving genotype calls. Each row is a locus (marker); each column is an individual (sample). Each element is a row index into a matrix in the list of translation tables stored in the transTables slot. Must have row and column names.
- errorMetrics: numeric matrix, parallel to the callCodes matrix. Each element gives an uncertainty measure for the corresponding element of the callCodes matrix. Must have row and column names.
- transTables: list of code translation tables. The list must have names. Each component is a matrix, and must include a column named "levels".
- missingCodes: list of allele missing-value codes, parallel to the transTables list. The list must have the same names as the list in the transTables slot. Each component is a character vector. Any allele symbol in component "abc" of the transTables list that appears in component "abc" of the missingCodes list is to be interpreted as a missing value by functions operating on the geneSet object. An empty list will be interpreted to mean that the data contains no missing values.
- sampleInfo: Object of class "data.frame"
- markerInfo: a dataframe, with one row for each row in the callCodes matrix. Must include columns "Name" and "TransTable".
- studyInfo: Object of class "list" ~~
- description: Object of class "character" ~~
- notes: Object of class "character" ~~
- ploidy: Object of class "numeric" ~~
- phase: 1. Yes/No for all (logical scalar) 2. Yes/No for each Marker (logical vector) 3. phaseObject (TBD): observation by marker by phase probabilities + definitions of contigs + probability of contigs

geneSet2Ped Translate a geneSet object to a ped matrix

### Description

Translate a geneSet object to a ped matrix.

## Usage

```
geneSet2Ped(geneSetObj)
```

#### Arguments

geneSetObj an object of geneSet class

## Value

A list with five elements: ped, columns, markerNames, Position, and fileName. ped is a pedigree data frame whose first 6 columns are family (pedigree id), pid (patient id), father (father id), mother (mother id), sex, affected (affection status). The remaining columns are pairs of marker alleles. Each row corresponds to an individual; columns are the names of the first 5 (or 6) columns of ped file. It should be either equal to c("family","pid","father","mother","sex","affected") or equal to c("family","pid","father","mother","sex"); founderOnly indicates if using only founder info; markerNames is a vector of marker names; Position is a vector of marker positions; fileName is the pedigree file name.

```

genotypeSummary print the summary of genotypes sorted by markers

## Description

print the summary of genotypes sorted by markers

## Usage

```
genotypeSummary(object,
    by = NULL,
    confidence = 0.95,
    alpha = 1 - confidence,
    show = TRUE,
    HWE.method = c("simulate", "exact"),
    simulate.p.value = TRUE,
    B = 10000,
    verbose = FALSE,
    includeOverall = FALSE,
    omitRepeats = TRUE,
    founderOnly = FALSE,
    ...)
```

## Arguments

object	geneSet object	
by	optional column name, by which the summary is desired. Default is NULL.	
confidence	confidence intervals of Genotype frequencies within each marker (default is $95\%$ )	
alpha	Type -1 error rate = $(1 - \text{confidence})$	
show	No longer used	
HWE.method	Method to be used for Hardy-Weinberg Equilibrium Significance Test, exact or simulate	
simulate.p.v	zalue	
	No longer used	
В	No longer used	
verbose	No longer used	
includeOverall		
	logical value (TRUE/FALSE) indicating whether overall summary is also needed, default = FALSE	
omitRepeats	logical value (TRUE/FALSE) indicating whether Gene name and marker name should be printed repeatedly for each Genotype, default = TRUE	
founderOnly	logical value (TRUE/FALSE) indicating whether founder information should be extracted from the geneSet object, default = FALSE	
	any further arguments to print	

## Details

We can print the genotypeSummary on screen, or save in .html format or .tex format

#### Author(s)

Nitin Jain <nitin.jain@pfizer.com>

## Examples

```
library(GeneticsBase)
data(CAMP)
temp <- genotypeSummary(CAMP)
print(temp)
txt(temp, filename="genotypeSummary.txt")
html(temp, filename="genotypeSummary.tml")
latex(temp, filename="genotypeSummary.tex")</pre>
```

```

gregorius	Probability of Observing All Alleles with a Given Frequency in a Sam-
	ple of a Specified Size.

## Description

Probability of observing all alleles with a given frequency in a sample of a specified size.

## Usage

gregorius(freq, N, missprob, tol = 1e-10, maxN = 10000, maxiter=100, showiter =

# Arguments

freq	(Minimum) Allele frequency (required)
Ν	Number of sampled genotypes
missprob	Desired maximum probability of failing to observe an allele.
tol	Omit computation for terms which contribute less than this value.
maxN	Largest value to consider when searching for N.
maxiter	Maximum number of iterations to use when searching for N.
showiter	Boolean flag indicating whether to show the iterations performed when searching for N.

#### Details

If freq and N are provided, but missprob is omitted, this function computes the probability of failing to observe all alleles with true underlying frequency freq when N diploid genotypes are sampled. This is accomplished using the sum provided in Corollary 2 of Gregorius (1980), omitting terms which contribute less than tol to the result.

When freq and missprob are provide, but N is omitted. A binary search on the range of [1,maxN] is performed to locate the smallest sample size, N, for which the probability of failing to observe all alleles with true underlying frequency freq is at most missprob. In this case, maxiter specifies the largest number of iterations to use in the binary search, and showiter controls whether the iterations of the search are displayed.

### Value

A list containing the following values:

call	Function call used to generate this object.
method	One of the strings, "Compute missprob given N and freq", or "Determine min- imal N given missprob and freq", indicating which type of computation was performed.
retval\$freq	Specified allele frequency.
retval\$N	Specified or computed sample size.
retval\$missp	rob
	Computed probability of failing to observe all of the alleles with frequency
	freq.

### Note

This code produces sample sizes that are slightly larger than those given in table 1 of Gregorius (1980). This appears to be due to rounding of the computed missprobs by the authors of that paper.

## Author(s)

Code submitted by David Duffy <davidD@qumr.edu.au>, substantially enhanced by Gregory R. Warnes <warnes@bst.rochester.edu>.

#### References

Gregorius, H.R. 1980. The probability of losing an allele when diploid genotypes are sampled. Biometrics 36, 643-652.

### Examples

```
# Compute the probability of missing an allele with frequency 0.15 when
# 20 genotypes are sampled:
gregorius(freq=0.15, N=20)
# Determine what sample size is required to observe all alleles with true
# frequency 0.15 with probability 0.95
gregorius(freq=0.15, missprob=1-0.95)
```

haplo.em.w Wrapper for EM computation of haplotype probabilities, with Progressive Insertion

# Description

Wrapper for EM computation of haplotype probabilities, with Progressive Insertion.

## Usage

## Arguments

geneSetObj	a geneSet object.
locus.label	vector of labels for loci.
miss.val	vector of values that represent missing alleles in geno.
weight	weights for observations.
control	list of control parameters. The default is constructed by the function haplo.em.control.

## Details

Please refer to haplo.em for more details.

## Value

list with components:

converge	indicator of convergence of the EM algorithm $(1 = \text{converge}, 0 = \text{failed})$ .
lnlike	value of lnlike at last EM iteration (maximum lnlike if converged).
lr	likelihood ratio statistic to test the final lnlike against the lnlike that assumes complete linkage equilibrium among all loci (i.e., haplotype frequencies are products of allele frequencies).
df.lr	degrees of freedom for likelihood ratio statistic. The df for the unconstrained final model is the number of non-zero haplotype frequencies minus 1, and the df for the null model of complete linkage equilibrium is the sum, over all loci, of (number of alleles - 1). The df for the lr statistic is df[unconstrained] - df[null]. This can result in negative df, if many haplotypes are estimated to have zero frequency, or if a large amount of trimming occurs, when using large values of min.posterior in the list of control parameters.
hap.prob	vector of mle's of haplotype probabilities. The ith element of hap.prob corresponds to the ith row of haplotype.
locus.label	vector of labels for loci, of length K (see definition of input values).
subj.id	vector of id's for subjects used in the analysis, based on row number of input geno matrix. If subjects are removed, then their id will be missing from subj.id.

rows.rem	now defunct, but set equal to a vector of length 0, to be compatible with other functions that check for rows.rem.
indx.subj	vector for row index of subjects after expanding to all possible pairs of haplo- types for each person. If indx.subj=i, then i is the ith row of geno. If the ith subject has n possible pairs of haplotypes that correspond to their marker geno- type, then i is repeated n times.
nreps	vector for the count of haplotype pairs that map to each subject's marker geno-types.
max.pairs	vector of maximum number of pairs of haplotypes per subject that are consistent with their marker data in the matrix geno. The length of max.pairs = nrow(geno). This vector is computed by geno.count.pairs.
hap1code	vector of codes for each subject's first haplotype. The values in hap1code are the row numbers of the unique haplotypes in the returned matrix haplotype.
hap2code	similar to hap1code, but for each subject's second haplotype.
post	vector of posterior probabilities of pairs of haplotypes for a person, given their marker phenotypes.
haplotype	matrix of unique haplotypes. Each row represents a unique haplotype, and the number of columns is the number of loci.
control	list of control parameters for algorithm. See haplo.em.control

## The function is currently defined as
"haplo.em.w"
```

haplo.scan.w	Wrapper for searching for a trait-locus by sliding a fixed-width win-
	dow over each marker locus and scanning all possible haplotype lengths within the window

## Description

Wrapper for searching for a trait-locus by sliding a fixed-width window over each marker locus and scanning all possible haplotype lengths within the window.

## Usage

```
haplo.scan.w(geneSetObj,
    width = 4,
    miss.val = c(0, NA),
    em.control = haplo.em.control(),
    sim.control = score.sim.control())
```

## Arguments

geneSetObj	A geneSet object
width	Width of sliding the window
miss.val	Vector of values that represent missing alleles in geno.
em.control	A list of control parameters to determine how to perform the EM algorithm for estimating haplotype frequencies when phase is unknown. The list is created by the function haplo.em.control - see this function for more details.
sim.control	List of control parameters to determine how simulations are performed for sim- ulated p-values. The list is created by the function score.sim.control and the default values of this function can be changed as desired. See score.sim.control for details.

### Details

Please refer to haplo.scan for more details.

### Value

A list that has class haplo.scan, which contains the following items:

call	The call to haplo.scan.w
scan.df	A data frame containing the maximum test statistic for each window around each locus, and its simulated p-value.
max.loc	The loci (locus) which contain(s) the maximum observed test statistic over all haplotype lengths and all windows.
globalp	A p-value for the significance of the global maximum statistic.
nsim	Number of simulations performed

haplo.score.slide.w

Wrapper for haplo.score.slide in haplo.stats package, which is used to identify sub-haplotypes from a group of loci

### Description

Wrapper for haplo.score.slide, which is used to identify sub-haplotypes from a group of loci. Run haplo.score on all contiguous subsets of size n.slide from the loci in a genotype matrix (geno). From each call to haplo.score, report the global score statistic p-value. Can also report global and maximum score statistics simulated p-values.

### Usage

```
haplo.score.slide.w(geneSetObj,
    trait.type = "gaussian",
    n.slide = 2,
    offset = NA,
    x.adj = NA,
    skip.haplo = 5/(2 * nrow(geno)),
    locus.label = NA,
    miss.val = c(0, NA),
    simulate = FALSE,
    sim.control = score.sim.control(),
    em.control = haplo.em.control())
```

# Arguments

geneSetObj	A geneSet object
trait.type	Character string defining type of trait, with values of "gaussian", "binomial", "poisson", "ordinal".
n.slide	Number of loci in each contiguous subset. The first subset is the ordered loci numbered 1 to n.slide, the second subset is 2 through n.slide+1 and so on. If the total number of loci in geno is n.loci, then there are n.loci - n.slide + 1 total subsets.
offset	Vector of offset when trait.type = "poisson"
x.adj	Matrix of non-genetic covariates used to adjust the score statistics. Note that intercept should not be included, as it will be added in this function.
skip.haplo	Skip score statistics for haplotypes with frequencies < skip.haplo. The de- fault is for an expected count of 5 out of the 2*N haplotype occurrences.
locus.label	Vector of labels for loci.
miss.val	Vector of values that represent missing alleles in geno.
simulate	Logical: if [F]alse, no empirical p-values are computed; if [T]rue, simula- tions are performed. Specific simulation parameters can be controlled in the sim.control parameter list.
sim.control	list of control parameters to determine how simulations are performed for sim- ulated p-values. The list is created by the function <pre>score.sim.control</pre> and the default values of this function can be changed as desired. See <pre>score.sim.control</pre> for details.
em.control	A list of control parameters to determine how to perform the EM algorithm for estimating haplotype frequencies when phase is unknown. The list is created by the function haplo.em.control - see this function for more details

## Details

Please refer to haplo.score.slide for more details.

# Value

List with the following components:

df	Data frame with start locus, global p-value, simulated global p-value, and simulated maximum-score p-value.
n.loci	Number of loci given in the genotype matrix.
simulate	Same as parameter description above.
n.slide	Same as parameter description above.
locus.label	Same as parameter description above.
n.val.haplo	Vector containing the number of valid simulations used in the maximum-score statistic p-value simulation. The number of valid simulations can be less than the number of simulations requested (by sim.control) if simulated data sets produce unstable variables of the score statistics.
n.val.global	Vector containing the number of valid simulations used in the global score statis- tic p-value simulation.

haplo.score.w	Wrapper for computing score statistics to evaluate the association of
	a trait with haplotypes, when linkage phase is unknown and diploid
	marker phenotypes are observed among unrelated subjects

## Description

wrapper for computing score statistics to evaluate the association of a trait with haplotypes, when linkage phase is unknown and diploid marker phenotypes are observed among unrelated subjects. For now, only autosomal loci are considered.

## Usage

# haplo.score.w

# Arguments

geneSet0bj	A geneSet object
trait.type	Character string defining type of trait, with values of "gaussian", "binomial", "poisson", "ordinal".
offset	Vector of offset when trait.type = "poisson"
x.adj	Matrix of non-genetic covariates used to adjust the score statistics. Note that intercept should not be included, as it will be added in this function.
skip.haplo	Skip score statistics for haplotypes with frequencies < skip.haplo. The de- fault is for an expected count of 5 out of the 2*N haplotype occurrences.
locus.label	Vector of labels for loci.
miss.val	vector of values that represent missing alleles in geno.
simulate	Logical: if [F]alse, no empirical p-values are computed; if [T]rue, simula- tions are performed. Specific simulation parameters can be controlled in the sim.control parameter list.
sim.control	List of control parameters to determine how simulations are performed for sim- ulated p-values. The list is created by the function score.sim.control and the default values of this function can be changed as desired. See score.sim.control for details.
em.control	A list of control parameters to determine how to perform the EM algorithm for estimating haplotype frequencies when phase is unknown. The list is created by the function haplo.em.control - see this function for more details

## Details

Please refer to haplo.score for more details.

# Value

List with the following components:

score.global	Global statistic to test association of trait with haplotypes that have frequencies >= skip.haplo.	
df	Degrees of freedom for score.global.	
score.global.	p	
	P-value of score.global based on chi-square distribution, with degrees of free-dom equal to df.	
score.global.	.p.sim	
	$P\mbox{-value of score.global based on simulations (set equal to NA when simulate=F)}.$	
score.haplo	Vector of score statistics for individual haplotypes that have frequencies >= skip.haplo.	
score.haplo.p		
	Vector of p-values for score.haplo, based on a chi-square distribution with 1 df.	
score.haplo.p.sim		
	Vector of p-values for score.haplo, based on simulations (set equal to NA when simulate=F).	
score.max.p.sim		
	Simulated p-value indicating for simulations the number of times a maximum score.haplo value exceeds the maximum score.haplo from the original data (equal to NA when simulate=F).	

haplotype	Matrix of hapoltypes analyzed. The ith row of haplotype corresponds to the ith item of score.haplo, score.haplo.p, and score.haplo.p.sim.
hap.prob	Vector of haplotype probabilies, corresponding to the haplotypes in the matrix haplotype.
locus.label	Vector of labels for loci, of length K (same as input argument).
simulate	Same as function input parameter. If [T]rue, simulation results are included in the haplo.score object.
n.val.global	Vector containing the number of valid simulations used in the global score statis- tic simulation. The number of valid simulations can be less than the number of simulations requested (by sim.control) if simulated data sets produce unstable variances of the score statistics.
n.val.haplo	Vector containing the number of valid simulations used in the p-value simula- tions for maximum-score statistic and scores for the individual haplotypes.

hapmapchr22

Chromosome 22 genotypes from International HapMap project

## Description

The sample data file, hapmapchr22, contains genotypes of hromosome 22 from the International HapMap project. This file contains genotypes from 30 CEPH trios (90 subjects) for all Phase 1 HapMap (about 1 SNP per 3kb on average) - see http://hapmap.org for the original data file, full details of samples, markers and methods. Note that the HapMap data files are deidentified and freely distributable without restriction.

## Usage

```
data(hapmapchr22)
```

#### homozygote

#### Format

The format is: chr "hapmapchr22"

#### Details

The file was created by converting chromosome 22 bulk data download data files from the HapMap file repository at http://hapmap.org/genotypes/2005-06\_16c\_phaseI/full/non-redundant/

Downloaded HapMap files were converted by transposing the layout of the data from one row per marker to the pedigree file convention of two columns per marker. There are many variants of the pedigree format but these files are compatible with the popular family based analysis software packages FBAT (http://www.biostat.harvard.edu/~fbat/fbat.htm) and PBAT (http://www.biostat.harvard.edu/~clange/default.htm)

The file has a header row containing only the marker names followed by one row per subject. Data rows always start with 6 fields - family\_id, individual\_id, father\_id, mother\_id, gender and affection status. Parents have zero for mother\_id and father\_id. The remaining columns in each row contain two allele codes for each marker. Alleles are coded as \$0\$ for missing, \$1=A\$, \$2=C\$, \$3=G\$ and \$4=T\$. All fields in a row are delimited by one or more spaces. Note that affection status was arbitrarily set to 2 (affected) for children and 1 (unaffected) for adults - although in reality, HapMap CEPH subjects were not ascertained for any disease.

### Examples

data(hapmapchr22)

homozygote

Flag observations with specific allele patterns

#### Description

homozygote Flag observations with identical alleles
heterozygote Flag observations with discordant alleles
carrier Flag observations containing a specified allele
dominant Flag observations containing one or more of the specified alleles.
recessive Flag observations containing only the specified alleles.

#### homozygote

### Usage

```
homozygote(object, ...)
homozygote.geneSet(object, allele.names, marker, ...)
heterozygote(object, ...)
heterozygote.geneSet(object, allele.names, marker, ...)
carrier(object, ...)
carrier.geneSet(object, allele.names, marker, ...)
dominant(object, ...)
dominant.geneSet(object, allele.names, marker, ...)
recessive(object, ...)
recessive.geneSet(object, allele.names, marker, ...)
```

## Arguments

object	geneSet object
allele.names	(optional) allele names.
marker	(optional) marker names
	(optional) additional arguments supplied

### Value

matrix of logicals.

### Author(s)

Gregory R. Warnes <warnes@bst.rochester.edu> and Nitin Jain <nitin.jain@pfizer.com>

#### See Also

# which ones are carriers for allele "2"?
carrier(lCAMP, allele.names="2")
# which markers are heterozygotes for marker m709
heterozygote(lCAMP, marker="m709")
```

#### html

```
# if '1' is dominant, which ones will show the
# '1' phenotype for marker m47?
dominant(lCAMP, allele.names="1", marker="m47")
# if '2' is recessive, which ones will show the
# '2' phenotype for marker m523?
recessive(lCAMP, allele.names="2", marker="p523")
```

html

Generate summary table files for genotype objects

## Description

Generate summary table files for genotype objects

## Usage

```
#### HTML file format
html
## S3 method for class 'LD':
html(x, filename = "", digits = 3, ...)
## S3 method for class 'GeneticsBaseSummary':
html(x, filename = "", ...)
## S3 method for class 'markerSummary':
html(x, filename = "", plot.format = "pdf",
                   sep=".", verbose=TRUE, ...)
#### plain text file format
t.xt.
## Default S3 method:
txt(x, filename="", eol="\n", ...)
## S3 method for class 'markerSummary':
txt(x, filename = "", plot.format = "pdf",
                   sep=".", verbose=TRUE, ...)
#### LaTex file format
latex
## Default S3 method:
latex(x, filename="", ...)
## S3 method for class 'LD':
latex(x, filename = "", digits = 3, ...)
## S3 method for class 'GeneticsBaseSummary':
latex(x, filename = "", ...)
## S3 method for class 'markerSummary':
latex(x, filename = "", plot.format = "pdf",
                   sep=".", verbose=TRUE, ...)
```

#### Arguments

Х	Object to be rendered to html/txt/latex
filename	Output filename, see below for details.
eol	End of line marker, defaults to "\n". MS-DOS/MS-Windows uses "\r\n"
digits	Number of digits to display
plot.format	Graphics format for LD plot. Only "pdf" is currently supported
sep	Separatior used to join the file prefix provided by filename and descriptive text when generating file names
verbose	Show names of created files.
	Additional parameters to pass to component methods

### Details

For alleleSummary, genotypeSummary, and LD objects, the filename argument is either the exact name of the file to be created, or "" which will print the output to the console.

For markerSummary objects, filename may be either "" or a prefix used to create file names. If filename="" all output is printed to the R console. Otherwise, filenames for each component are constructed by combining the prefix specified by filename, the separator specified by sep, a string descibing the file contents (one of "alleleSummary", "genotypeSummary", and "LD"), and the file extension ".html".

#### Value

Nothing of interest

makeMarkerInfo makeMarkerInfo creates a dataframe of marker information

### Description

An auxilliary funtion to create a dataframe for the slot markerInfo of class geneSet

#### Usage

```
makeMarkerInfo(loci = character(0), transTable = loci)
```

### Arguments

loci	a vector of makrer loci
transTable	corresponding translation table for the markers at each locus.must have same length with vector loci

## Value

A dataframe with one row for each row in the callCodes slot of class geneSet. Include columns "Name" and "TransTable".

### Author(s)

Scott Chasalow <Scott.Chasalow@bms.com>, Junsheng Cheng <cjsuicedu@yahoo.com>

makeTransTable makeTransTable creates a single translation table of the markers

## Description

Create a single translation table of the markers. It is called by makeTransTableList to make a list of translation tables.

## Usage

```
makeTransTable(alleleString = "Aa", sep = "/", ploidy = 2)
```

#### Arguments

alleleString	character vector such as c("12", "ACGT")
sep	separation symbol of the allels in alleleString
ploidy	Currently implemented only for ploidy=2

## Value

a matrix of (\# of alleles in alleleString)\^2 by ploidy, and must include a column named "levels".

## Author(s)

Scott Chasalow <Scott.Chasalow@bms.com>, Junsheng Cheng <cjsuicedu@yahoo.com>

makeTransTableList makeTransTableList creates a list of translation tables

### Description

Calls makeTransTable to create each item of the list.

#### Usage

```
makeTransTableList(alleleStringVec, listNames = NULL)
```

#### Arguments

alleleStringVec

character vector such as c("12", "ACGT") listNames names of translation tables

### Value

If it is a LIST, use:

compl	Description of 'comp1'
comp2	Description of 'comp2'

•••

## Author(s)

Scott Chasalow <Scott.Chasalow@bms.com>, Junsheng Cheng <cjsuicedu@yahoo.com>

## Examples

```
## Not run:
    # End of \dontrun
```

markerInfo ~~ function to do ... ~~

## Description

~~ A concise (1-5 lines) description of what the function does. ~~

## Usage

```
markerInfo(object, ...)
markerInfo(object)<- value</pre>
```

#### Arguments

object	~~Describe object here~~
value	~~Describe value here~~
	~~Describe here~~

### Details

~~ If necessary, more details than the description above ~~

## Value

~Describe the value returned If it is a LIST, use

compl	Description of 'comp1'
comp2	Description of 'comp2'

markerSummary Generate allele, genotype, or LD summary objects

## Description

Generate allele, genotype, or LD summary objects

## Usage

## Arguments

object	geneSet object
covariate	
confidence	desired confidence interval for genotype and allele frequencies in each marker
alpha	Type -1 error rate = $(1 - \text{confidence})$
show	No longer used
х	object of class 'markerSummary'
	optional additional arguments

### Details

We can print the alleleSummary and genotypeSummary on screen, or save in html, tex, or pdf format using appropriate methods.

## Author(s)

Nitin Jain <nitin.jain@pfizer.com>

## missingCodes

## Examples

ped2geneSet translate a ped matrix to a geneSet object

## Description

Translate a ped matrix to a geneSet object.

## Usage

ped2geneSet(ped0bj, quiet=FALSE)

## Arguments

ped0bj	a list with five elements: ped, columns, markerNames, Position, and fileName. ped is a pedigree data frame whose first 6 columns are family (pedigree id), pid (patient id), father (father id), mother (mother id), sex, affected (affection status). The remaining columns are pairs of marker alleles. Each row corresponds to an individual; columns are the names of the first 5 (or 6) columns of ped file. It should be either equal to c("family","pid","father","mother","sex","affected") or equal to c("family","pid","father","mother","sex"); founderOnly indicates if using only founder info; markerNames is a vector of marker names; Position is a vector of marker positions; fileName is the pedidgree file name.
quiet	print intermediate results if quiet=FALSE.

### Value

An object of geneSet class.

```

plot.LD

## Description

Textual and graphical display of linkage disequilibrium (LD) objects

## Usage

```
plot(x, y, ...)
plot.LD (x, y=NULL, cex, ...)
LDView(LdMat,
        SNPloc=NULL,
        is.triangle=TRUE,
        SNPnames=NULL,
        cexSNPnames=0.2+1/log10(nrow(LdMat)),
        margins=c(6,2,3,6),
        main=NULL,
        barCol=rainbow(256,start=0,end=1/6),
        widths=c(10,10),
        heights=c(1,10),
        ...)
```

## Arguments

Х	LD or LDband object
У	currently ignored
cex	Scaling factor for table text. If absent, text will be scaled to fit within the table cells.
LdMat	matrix of pair-wise LD measures
SNPloc	SNP locations
is.triangle	indicate if 'LdMat' is a lower triangle matrix or not. if 'LdMat' is an upper triangle, then the user has to transpose it before calling the function 'LDView'.
SNPnames	labels for SNPs
cexSNPnames	font size for SNPs labels
margins	margins for heatmap
main	title for the plot
barCol	specify the color scheme
widths	The plot is split into two parts – upper part and lower part 'widths' specifies the widths of the two parts

#### plot.LD

heights	The plot is split into two parts – upper part and lower part 'heights' specifies the heights of the two parts
	Optional arguments (plot.LD.data.frame passes these to LDtable and LDplot) and other parameters for the function 'image'

## Details

LDtable generates a graphical matrix of LD coefficients. It attempts to properly set the font size so that the estimated values fit into the boxes. It also colorized the boxes to whether the estimates are significantly different from no linkage.

LDplot generates a plot of the LD coefficients across markers. By default it will overlay plots for LD against all markers. LD against a specific subset of markers can be obtained using the marker argument.

## Value

SNPnames	labels of the SNPs in LDView
LdMat	LD matrix
SNPloc	SNP positions

#### Author(s)

Gregory R. Warnes <warnes@bst.rochester.edu>

#### See Also

read.phe

Read '.phe' phenotype file data

# Description

Read '.phe' phenotype file data

#### Usage

```
read.phe(filename, columns = c("family", "pid"), quiet = FALSE, ...)
read.fbat.phe(filename, columns = c("family", "pid"), quiet = FALSE, ...)
read.pbat.phe(filename, columns = c("family", "pid"), quiet = FALSE, ...)
```

# Arguments

filename	Name of the file
columns	Column names for the first two columns of a pedigree file. Defaults to "family" and "pid", where "family" is a unique identifier for each family, and "pid" is a unique identifier for each individual.
quiet	Logical indicating whether progress display is suppressed, Defaults to TRUE.
•••	Additional (optional) parameters provided to function matrix

## Value

A data frame containing the file

#### Author(s)

Gregory R. Warnes <warnes@bst.rochester.edu> and Nitin Jain <nitin.jain@pfizer.com>

# Examples

readGenes

Import genetic data from standard file formats

# Description

Import genetic data from standard file formats.

# Usage

#### readGenes

#### Arguments

gfile	File containing genotype data
gformat	Function, function name, or a character file format specification from the list genotypeFileFormats.
goptions	Optional arguments for loading genotype data.
pfile	File containing phenotype data
pformat	Function, function name, or a character file format specification from the list ${\tt phenotypeFileFormats}.$
poptions	Optional arguments for loading phenotype data.
mfile	File containing marker data
mformat	Function, function name, or a character file format specification from the list ${\tt markerFileFormats}.$
moptions	Optional arguments for loading marker data.

#### Details

Load genotype and (optionally) phenotype and marker information from the specified files and generate a geneSet object containing the results.

A variety of file formats are available. See the variables genotypeFileFormats, phenotypeFileFormats, phenotypeFileFormats for formats.

## Value

An object of class geneSet.

#### Note

Adding a new genotype (phenotype) file format requires creation of a function named readGenes.newformat (read.newformat) and adding the string "newformat" to the vector genotypeFileFormats (phenotypeFileFormats).

Please submit new format functions to the authors for inclusion in the package.

```

readGenes.ped Function to read pedigree file format

# Description

}

Function to read pedigree file format

# Usage

#### Arguments

filename	Name of the file in which data is stored
columns	Name of the columns in the pedigree file - by default points to "family", "pid", "father", "mother", "sex"
phase	1. Yes/No for all (logical scalar) 2. Yes/No for each Marker (logical vector) 3. phaseObject (TBD): observation by marker by phase probabilities + definitions of contigs + probability of contigs
quiet	Logical: whether the progress of reading the file should be displayed.
missingval	Missing values (if any) to obtain missingCodes
	Additional arguments to function read.table

#### Author(s)

Gregory R. Warnes <warnes@bst.rochester.edu> and Nitin Jain <nitin.jain@pfizer.com>

readGenes.perlegen Read Perlegen data files.

# Description

Read Perlegen data files.

#### Usage

```
readGenes.perlegen(filename, ..., quiet = FALSE)
```

#### Arguments

filename	Name of the file in which data is stored
	Additional arguments to scan
quiet	Whether the progress of loading data should be displayed.

# Author(s)

Gregory R. Warnes <warnes@bst.rochester.edu> and Nitin Jain <nitin.jain@pfizer.com>

readGenes.pfizer Read genetics data files that use Pfizer's data format.

# Description

Read genetics data files that use Pfizer's data format.

# Usage

#### Arguments

filename	Name of the file in which data is stored
phase	see below
format	Format of the file to be read, one of "Pivot" or "Listing"
	Additional arguments to function read.table

# Details

The argument phase may be:

- 1. 1A single logical scalar value that applies for all markers
- 2. 2A logical vector with one element per marker
- 3. 3A phaseObject (TBD) providing observation by marker by phase probabilities + definitions of contigs + probability of contigs

xbat

Simulated pedigree with genotypes and covariates

# Description

Simulated dataset for a pedigree of 1000 trios with 50 SNPs, with 8 quantitative traits, 2 binary traits, and 8 covariates."

## Usage

data(xbat)

# Format

'geneSet' object

#### Details

82

This data is the 'xbat' example from Lange and Kraft's "Short Course: Genetics Associateion Analysis." It is described there as:

"[This] simulated dataset comprises a pedigree file with genotype information for 1000 trios with 50 SNPs and a phenotype file that contains 8 quantitative traits, 2 binary traits, and 8 covariates.

# "Genotypes

"The simulation generated complete genotype data for 1000 families with two parents and one offspring. The single nucleotide polymorphism (SNP) frequencies and haplotype blocks were estimated using real data. These estimates were fixed and used as parameters for the simulation of the parental genotypes. Offspring genotypes were generated by simulating random Mendelian transmission from their respective parents. In total, 50 SNPs were simulated, 28 of which lie in 1 of 5 variable length haplotype blocks (range: 4 to 10 SNPs per block). The blocks were simulated as a function of haplotype block frequency, assuming no recombination, resulting in varying degrees of linkage disequilibrium within each block. The remaining 22 SNPs that are not in a haplotype block were simulated randomly as a function of SNP frequency. The SNPs are indicated in the header line of the pedigree file, and named SNP1, SNP2, ..., and SNP50. Note that the affectation status variable in the pedigree file is coded as missing (0) for all individuals. All phenotype data comes from the phenotype file (see below).

#### "Phenotypes

"Overall, 10 phenotypes (\$Y\$) were simulated additively as function of the genetic effect size a, marker score \$X\$, covariate effect size \$b\$, and covariate value \$Z\$ as follows:

 $Y_i = a_i X_i + b_i Z_i \ (i = 1, 2, ..., 10)$ 

#### "Quantitative Traits

"Eight quantitative phenotypes were simulated from a random sample from a normal distribution:  $Y \sim N([aX+bZ], s2)$ , where a is the additive effect for the phenotype and s2 is the variance. We measure the strength of the additive effect relative to the phenotypic variation explained by genetic variation. We assume that the environment variance is 1. SNP23 was simulated as the "disease SNP" which is the 5th SNP in a 10 SNP haplotype block. The heritabilities were simulated from random uniform distribution ranging from -0.1 to 0.1. In addition, the simulation produced two correlated quantitative traits (QTL9 and QTL10; r2 = 0.40). The quantitative traits are indicated in the header line of the phenotype file and named QTL1, QTL2, ..., and QTL10.

#### "Binary Traits

"Two binary traits were simulated simply by dichotomizing the first quantitative trait (QTL1). For the AFF1 trait, individuals were coded as affected (1) if their QTL1 value is above the sample mean and unaffected (0) if their QTL1 value was below the sample mean. For the AFF2 trait, individuals were coded as affected (1) if their QTL1 value is at least one standard deviation above the sample mean, and missing ("-") if their trait value did not reach that criteria.

#### "Covariates

"In addition to the additive genetic effect, each phenotype was simulated with one covariate effect. The quantitative covariates were sampled from normal distribution (mu = random, s2 = 10). The effect size for each covariate was sampled randomly from a uniform distribution (0, 1). The covariates are indicated in the header line of the phenotype file and named COV1, COV2, ..., and COV10. Note that COV1 corresponds to QTL1, AFF1 and AFF2."

(quoted from Lange and Kraft 2005)
