# Description

Structures for vocabularies and narratives of views. This can be used to create HTML views of the package structure in a Bioconductor repository.

# **Details**

Package: biocViews Version: 1.11.4

Depends: R (>= 2.4.0), methods, utils

Imports: tools, Biobase, graph (>= 1.9.26), RBGL (>= 1.13.5), XML

Suggests: Biobase License: Artistic-2.0

URL: http://www.bioconductor.org/packages/release/BiocViews.html

biocViews: Infrastructure

#### Index:

BiocView-class Class "BiocView" Htmlized-class Class "Htmlized" PackageDetail-class Class "PackageDetail"

RepositoryDetail-class

Class "RepositoryDetail"

biocViewsVocab Bioconductor Task Views Vocabulary Data extractVignettes Extract pdf vignettes from local package

repository

genReposControlFiles

Generate CRAN-style repository control files getBiocSubViews

Build a list of BiocView objects from a package

repository

Build a list of BiocView objects from a package getBiocViews

repository

getPacksAndViews Parse VIEWS file for views and packages

getSubTerms Retrieve a term and its children from a vocab

htmlDoc Create a complete HTML document representation

of an object

htmlFilename Return a filename for an object's HTML

representation

htmlValue HTML Representation of an Object

writeBiocViews Write a list of BiocView objects to HTML writeHtmlDoc Write an XML DOM containing HTML to a file

writePackageDetailHtml

Write HTML files for packages in a CRAN-style

repository

writeRepositoryHtml Write package descriptions and a repository

index as HTML

writeTopLevelView Write the view for the root of a vocabulary to

disk

write\_REPOSITORY Write a REPOSITORY control file for a

CRAN-style package repository

write\_SYMBOLS Write a SYMBOLS file

write\_VIEWS Write a VIEWS control file for a CRAN-style

package repository

The terms of the vocabulary are stored in a DAG, which can be loaded as the serialized data object biocViewsVocab. For listing of available terms use function getSubTerms.

Further information is available in the following two vignettes:

#### Author(s)

VJ Carey <stvjc@channing.harvard.edu>, BJ Harshfield <rebjh@channing.harvard.edu>, S Falcon <sfalcon@fhcrc.org>

Maintainer: Biocore Team c/o BioC user list <bioconductor@stat.math.ethz.ch>

# **Examples**

```
data(biocViewsVocab)
getSubTerms(biocViewsVocab, "Technology")
```

BiocView-class

Class "BiocView"

# Description

Representation of of Bioconductor "view".

### **Objects from the Class**

Objects can be created by calls of the form new("BiocView", ...).

#### **Slots**

```
name: Object of class "character" giving the name of the view.
subViews: Object of class "character" giving the names of the subviews of this view.
parentViews: Object of class "character" giving the names of the views that are this view's parents.
Title: Object of class "character" giving longer description of view?
reposRoot: Object of class "character" URL for repository
homeUrl: Object of class "character" ?
htmlDir: Object of class "character" ?
packageList: Object of class "list" consisting of PackageDetail-class objects
```

#### **Extends**

```
Class "RepositoryDetail", directly. Class "Htmlized", directly.
```

### Methods

```
coerce signature(from = "BiocView", to = "rdPackageTable"): ...
htmlDoc signature(object = "BiocView"): ...
htmlFilename signature(object = "BiocView"): ...
htmlValue signature(object = "BiocView"): ...
show signature(object = "BiocView"): ...
```

bioc Views Vocab 5

### Author(s)

Seth Falcon

biocViewsVocab

Bioconductor Task Views Vocabulary Data

# **Description**

A graphNEL-class instance representing the Bioconductor Task Views as a directed graph.

#### **Usage**

```
data(biocViewsVocab)
```

#### **Format**

The format is: graphNEL instance

#### **Details**

The source for the vocabulary data is in the dot directory of the package in file biocViewsVocab.dot. This is transformed to GXL using the dot2gxl command line utility from the graphviz package. Then the fromGXL function from the graph package is used to convert to graphNEL-class.

### **Examples**

```
data(biocViewsVocab)
biocViewsVocab
## If you have Rgraphviz available, you can
## plot the vocabulary with plot(biocViewsVocab)
```

extractManuals

Extract Rd man pages and build pdf reference manuals from local package repository

# **Description**

This function extracts Rd man pages and builds pdf reference manuals from the man subdirectory of R source packages archives (.tar.gz) found in a local package repository.

All Rd files found in man will be extracted and used during the pdf construction process. Only source package archives will be processed. The constructed pdf files will be extracted under destDir and will be found in PKGNAME/man/\*.pdf.

Prior to extraction, all Rd and pdf files in destDir/PKGNAME/man will be removed.

6 extractNEWS

### Usage

```
extractManuals(reposRoot, srcContrib, destDir)
```

# Arguments

reposRoot character vector giving the path to the root of the local CRAN-style package

repository

srcContrib character vector giving the relative path from the reposRoot to the source pack-

ages. In a standard CRAN-style repository, this will be src/contrib.

destDir character vector specifying the directory in which the extracted files will be

written. If missing, files will be written to <reposRoot>/manuals.

### Author(s)

Patrick Aboyoun

extractNEWS Extract NEWS files from source package tarballs

# **Description**

Extracts NEWS files from source tarballs of packages.

# Usage

```
extractNEWS(reposRoot, srcContrib, destDir)
```

# **Arguments**

reposRoot Top level path for CRAN-style repos

srcContrib Location of source packages

destDir where to extract

extractTopLevelFiles 7

# **Description**

Extracts files from source tarballs of packages.

# Usage

```
extractTopLevelFiles(reposRoot, srcContrib, destDir, fileName)
```

# **Arguments**

reposRoot Top level path for CRAN-style repos

srcContrib Location of source packages

destDir where to extract

fileName name of file to extract

# **Description**

These functions extract pdf or HTML files from the inst/doc subdirectory of R source packages archives (.tar.gz) found in a local package repository.

All pdf files found in inst/doc will be extracted. With extractHTMLDocuments, all HTML files except index.html will be extracted. Only source package archives will be processed. The extracted pdf or HTML files will be extracted under destDir and will be found in PKGNAME/inst/doc/.

Prior to extraction, all pdf files in destDir/PKGNAME/inst/doc will be removed.

# Usage

```
extractVignettes(reposRoot, srcContrib, destDir)
extractHTMLDocuments(reposRoot, srcContrib, destDir)
```

# **Arguments**

reposRoot ch	haracter vector giving	the path to the root of the	local CRAN-style package
--------------	------------------------	-----------------------------	--------------------------

repository

srcContrib character vector giving the relative path from the reposRoot to the source pack-

ages. In a standard CRAN-style repository, this will be src/contrib.

destDir character vector specifying the directory in which the extracted files will be

written. If missing, files will be written to <reposRoot>/vignettes.

8 getBiocSubViews

### Author(s)

Seth Falcon

genReposControlFiles Generate CRAN-style repository control files

# **Description**

This function generates control files for CRAN-style repositories. For each path specified in contribPaths a PACKAGES file is written. In addition, two top-level control files are created:

REPOSITORY contains information about the specified contrib paths.

VIEWS contains metadata for all packages in the repository including the paths to any extracted vignettes, if found. This file is useful for generating HTML views of the repository.

### Usage

genReposControlFiles(reposRoot, contribPaths)

#### **Arguments**

reposRoot

character vector containing the path to the CRAN-style repository root directory.

contribPaths

A named character vector. Valid names are source, win.binary, win64.binary, mac.binary, and mac.binary.leopard. Values indicate the paths to the pack-

age archives relative to the reposRoot.

### Author(s)

Seth Falcon

#### See Also

write\_PACKAGES, extractVignettes, write\_REPOSITORY, write\_VIEWS

getBiocSubViews

Build a list of BiocView objects from a package repository

# **Description**

This function returns a list of BiocView-class objects corresponding to the subgraph of the views DAG induced by topTerm. In short, this does the same thing as getBiocViews, but limits the vocabulary to topTerm and all of its decendents.

#### Usage

```
getBiocSubViews(reposUrl, vocab, topTerm, local = FALSE, htmlDir = "")
```

getBiocSubViews 9

# **Arguments**

reposUrl	URL for a CRAN-style repository that hosts a VIEWS file at the top-level.
vocab	A graph-class object representing the ontologyof views. This graph should be a directed acyclic graph (DAG).
topTerm	A string giving the name of the subview DAG. This view and all of its decendents will be included in the result.
local	logical indicating whether to assume a local package repository. The default is FALSE in which case absolute links to package detail pages are created.
htmlDir	if the local argument is TRUE, this will be used as the relative path for package HTML files.

#### **Details**

The root of the vocabulary DAG is implicitly included in the view creation process order to build views with a link back to the top. It is removed from the return list.

This function is tailored to generation of Bioconductor Task Views. With the current vocabulary, it probably only makes sense to call it with topView set to one of "Software", "AnnotationData", or "ExperimentData". This is a hack to allow the biocViews code to manage HTML views across more than one repository.

# Value

A list of BiocView-class objects. The names of the list give the name of the corresponding view.

### Author(s)

Seth Falcon

#### See Also

```
write_VIEWS, writeBiocViews
```

# **Examples**

```
data(biocViewsVocab)
reposPath <- system.file("doc", package="biocViews")
reposUrl <- paste("file://", reposPath, sep="")
biocViews <- getBiocSubViews(reposUrl, biocViewsVocab, "Software")
print(biocViews[1:2])</pre>
```

10 getBiocViews

getBiocViews	Build a list of BiocView objects from a package repository

# **Description**

Given the URL to a CRAN-style package repository containing a VIEWS file at the top-level and a graph-class object representing a DAG of views, this function returns a list of BiocView-class objects.

# Usage

```
getBiocViews(reposUrl, vocab, defaultView, local = FALSE, htmlDir = "")
```

# **Arguments**

reposUrl	URL for a CRAN-style repository that hosts a VIEWS file at the top-level.
vocab	A graph-class object representing the ontology of views. This graph should be a directed acyclic graph (DAG).
defaultView	A string giving the term to use for packages that do not list a term of their own via the biocViews field in the 'DESCRIPTION' file.
local	logical indicating whether to assume a local package repository. The default is FALSE in which case absolute links to package detail pages are created.
htmlDir	if the local argument is TRUE, this will be used as the relative path for package HTML files.

### Value

A list of BiocView-class objects. The names of the list give the name of the corresponding view.

### Author(s)

Seth Falcon

### See Also

```
write_VIEWS, writeBiocViews
```

# **Examples**

```
data(biocViewsVocab)
reposPath <- system.file("doc", package="biocViews")
reposUrl <- paste("file://", reposPath, sep="")
biocViews <- getBiocViews(reposUrl, biocViewsVocab, "NoViewProvided")
print(biocViews[1:2])</pre>
```

getCurrentbiocViews 11

getCurrentbiocViews Get a

Get a list of biocViews for each branch

# **Description**

This function looks returns a list containing all the biocViews that are present on the Bioconductor website.

# Usage

```
getCurrentbiocViews()
```

#### **Details**

It parses the dot file present inside the biocViews package.

### Value

It returns a named list with 3 components.

Software biocViews from the software branch

ExperimentData biocViews from the ExperimentData branch
AnnotationData biocViews from the AnnotationData branch

# Author(s)

Sonali Arora

# **Examples**

```
ans <- getCurrentbiocViews()
## only the first 6 from each branch are shown here.
lapply(ans, head)</pre>
```

getPackageNEWS

Retrieve and print package NEWS

# Description

These functions visit two repository PACKAGE files, identifying packages that are present in the 'current' repository and have NEWS since the base version of the same package in the 'previous' repository. All NEWS is reported for packages only in the current repository.

12 getPacksAndViews

### Usage

# **Arguments**

prevRepos	character(1) repository from which NEWS starts.
currRepos	character(1) repository of current packages.
srcDir	character(1) directory containing the source all current pacakges
dbs	A list of news_db elements, as returned by getPackageNEWS.
destfile	character(1) file path to the location where NEWS will be printed.
overwrite	logical(1) indicating whether destfile can be over-written, if it exists.
width	numeric(1) number of characters news items are to be wrapped to, excluding indent.
output	character(1) output to text or markdown format.
	additional arguments, unused.

#### Value

A list of news\_db files, as returned by utils::news, for each package for which relevant NEWS is available.

# Author(s)

Martin Morgan mtmorgan@fhcrc.org

getPacksAndViews	Parse VIEWS file for views and packages	
------------------	---	--

# **Description**

Given a repository URL, download and parse the VIEWS file.

# Usage

```
getPacksAndViews(reposURL, vocab, defaultView, local=FALSE)
```

getSubTerms 13

# Arguments

reposURL character vector giving the URL of a CRAN-style repository containing a VIEWS

file at the top-level.

vocab A graph-class object representing the ontology of views. This graph should be

a directed acyclic graph (DAG).

defaultView A string giving the term to use for packages that do not list a term of their own

via the biocViews field in the 'DESCRIPTION' file.

local logical indicating whether certain links should be absolute (using reposURL) or

relative.

### Value

A list with named elements:

views: Vector of view memberships. Names are package names.

pkgList: A list of PackageDetail-class objects.

### Author(s)

Seth Falcon

getSubTerms Retrieve a term and its children from a vocab DAG

# Description

Given a Directed Acyclic Graph (DAG) represented as a graphNEL instance, return a character vector consisting of the specified term and all of its descendants. That is, give the list of terms for which a path exists starting at term.

### Usage

```
getSubTerms(dag, term)
```

# **Arguments**

dag A graphNEL representing a DAG

term A string giving a term in the vocabulary (a node in dag)

#### Value

A character vector of term names.

### Author(s)

S. Falcon

14 htmlFilename

### **Examples**

```
data(biocViewsVocab)
getSubTerms(biocViewsVocab, "Software")
```

htmlDoc

Create a complete HTML document representation of an object

# Description

This generic function should return an XMLNode instance representing the specified object in HTML as a complete HTML document.

# Usage

```
htmlDoc(object, ...)
```

# **Arguments**

object An object
... Not currently used.

#### Value

An instance of XMLNode from the XML package.

# Author(s)

Seth Falcon

### See Also

htmlValue, htmlFilename

htmlFilename

Return a filename for an object's HTML representation

# **Description**

This function returns a string containing an appropriate filename for storing the object's HTML representation.

### Usage

```
htmlFilename(object, ...)
```

Htmlized-class 15

# **Arguments**

object An object.

... Not currently used

# Value

A character vector of length one containing the filename.

# Author(s)

Seth Falcon

### See Also

htmlValue, htmlDoc

Htmlized-class

Class "Htmlized"

# Description

A virtual class for HTML serialization method dispatch.

# **Objects from the Class**

A virtual Class: No objects may be created from it.

# Methods

htmlDoc signature(object = "Htmlized"): Return the html-ized representation of object as
a complete HTML document.

# Author(s)

Seth Falcon

16 PackageDetail-class

htmlValue

HTML Representation of an Object

# Description

This generic function should return an XMLNode instance representing the specified object in HTML

# Usage

```
htmlValue(object)
```

# Arguments

object

An object

# Value

An instance of XMLNode from the XML package.

# Author(s)

Seth Falcon

# See Also

htmlDoc, htmlFilename

PackageDetail-class

Class "PackageDetail"

# Description

Representation of R package metadata. Most slots correspond to fields in a package's DESCRIP-TION file.

# **Objects from the Class**

Objects can be created by calls of the form new("PackageDetail", ...).

PackageDetail-class 17

#### **Slots**

Package: Object of class "character" see DESCRIPTION
Version: Object of class "character" see DESCRIPTION
Title: Object of class "character" see DESCRIPTION

Description: Object of class "character" see DESCRIPTION

Author: Object of class "character" see DESCRIPTION

Maintainer: Object of class "character" see DESCRIPTION

Depends: Object of class "character" see DESCRIPTION

Imports: Object of class "character" see DESCRIPTION

Suggests: Object of class "character" see DESCRIPTION

SystemRequirements: Object of class "character" see DESCRIPTION

License: Object of class "character" see DESCRIPTION

URL: Object of class "character" see DESCRIPTION

biocViews: Object of class "character" see DESCRIPTION

vignettes: Object of class "character" giving paths to vignette pdf files in the repository

vignetteScripts: Object of class "character" giving paths to vignette Stangled R files in the repository

vignetteTitles: Object of class "character" giving the titles of the vignette files in the repository

source.ver: Object of class "character" version string for the source package

win.binary.ver: Object of class "character" version string for the 32-bit Windows binary package

win64.binary.ver: Object of class "character" version string for the 64-bit Windows binary package

mac.binary.leopard.ver: Object of class "character" version string for the OS X Leopard binary package

downloadStatsUrl: Object of class "character" An optional URL for the download history statistics.

manuals: Object of class "character" giving paths to reference manual pdf files in the repository dependsOnMe: Object of class "character" giving packages found in the repository that depend on this package

importsMe: Object of class "character" giving packages found in the repository that imports this package

suggestsMe: Object of class "character" giving packages found in the repository that suggest this package

functionIndex: Object of class "character" Not used. Intended to hold function index data.

reposFullUrl: Object of class "character" The URL for the full URL of the root of the repository.

reposRoot: Object of class "character" The URL for the root of the repository.

viewRoot: Object of class "character" The URL for the view of the repository.

devHistoryUrl: Object of class "character" The URL for the development changelog.

18 PackageDetail-class

#### **Extends**

```
Class "Htmlized", directly.
```

#### Methods

htmlDoc signature(object = "PackageDetail"): Return an XMLNode instance containg a complete HTML document representation of the package.

htmlFilename signature(object = "PackageDetail"): Return a filename appropriate for the HTML document representation.

htmlValue signature(object = "PackageDetail"): Return XMLNode instance containing an HTML representation of the package.

#### **Details**

pdAuthorMaintainerInfo-classpdVignetteInfo-classpdDownloadInfo-classpdDetailsInfo-classpdDescriptionInfo-classpdVigsAndDownloads-class

Dummy classes for HTML generation. Each dummy class is a simple extension (it does not add any slots). The purpose of each dummy class is to allow for method dispatch to generate HTML via the htmlValue method.

You can convert convert a PackageDetail instance to one of the dummy classes like this: descInfo <- as(pdObj,

"pdDe

        vignetteScripts="vignettes/MyFancyPackage/inst/doc/MFP1.R\nvignettes/MyFancyPackage/inst/doc/MFP2.R",
          vignetteTitles="MFP1 Document, \nMFP2 Document",
          source.ver="src/contrib/MyFancyPackage_1.2.3.tar.gz",
          win.binary.ver="bin/windows/contrib/2.6/MyFancyPackage_1.2.2.zip",
          win64.binary.ver="bin/windows64/contrib/2.6/MyFancyPackage_1.2.2.zip",
        mac.binary.leopard.ver="bin/macosx/leopard/contrib/2.6/MyFancyPackage_1.2.3.tgz",
          dependsOnMe=c("PackageThatExposesMe"),
          importsMe=c("AnEvenFancierPackage", "AMuchFancierPackage"),
          suggestsMe="PackageThatUsesMeInVignette",
```

recommendBiocViews 19

```
html <- htmlValue(pd)
pd</pre>
```

recommendBiocViews

Recommend biocViews for an existing Package.

### Description

Packages being added to the Bioconductor Project require biocViews in their DESCRIPTION file.(Note that the field name "biocViews" is case-sensitive and must begin with a lower-case 'b'.)biocViews are "keywords" which are used to describe a given package. They are broadly divided into three categories, representing the type of packages present in the Bioconductor Project - Software, Annotation Data and Experiment Data.

# Usage

```
recommendBiocViews(pkgdir, branch)
```

### **Arguments**

pkgdir The path of the package Directory.

branch The branch which your package will belong to. It can be either 'Software',

'AnnotationData' or 'ExperimentData'.

### **Details**

This function parses the package directory provided by the user to recommend biocViews to the user. The output is a suggested list - the user of this function is expected to go through this list and find which biocViews best describe his or her package. It uses the following strategies.

- It parses the "Description", "Title", "Package" of the DESCRIPTION page to find biocViews.
- It looks up the biocViews of the packages in the "Depends" field of the given package to recommend biocViews
- It parses the text from the man pages and the vignettes to suggest biocViews.

Please note the following:

- Do not make up your own biocViews.
- Double check the spelling and case of the biocViews added.
- Please add biocViews only from the appropriate branch. eg: Software packages should have only Software biocViews.

#### Value

A list is returned with 3 characters - current, recommended and remove.

- "current" contains the biocViews from the package's DESCRIPTION file.
- "recommended" are the recommended biocViews This is a suggested list which the user can add in addition to "current" biocViews the user is expected to go through this list and find which biocViews best describe their package.
- "remove" are those biocViews which are inconsistent with the Bioconductor biocViews. (Hint check for spelling, cases and plural)

validate\_bioc\_views 21

validate\_bioc\_views

Validate a package's biocViews.

# **Description**

Ensures that a package has biocViews and that they are valid. Function is designed to be called from the unit tests of another package.

# Usage

```
validate_bioc_views(pkg)
```

# **Arguments**

pkg

character(1) Name of package to validate.

#### Value

invisible(NULL) if tests pass.

# Author(s)

Dan Tenenbaum dtenenba@fhcrc.org

# **Examples**

```
validate_bioc_views("biocViews")
```

writeBiocViews

Write a list of BiocView objects to HTML

# **Description**

This function serializes a list of BiocView-class objects to a series of HTML files.

# Usage

```
writeBiocViews(bvList, dir, backgroundColor="transparent")
```

# **Arguments**

bvList A list of BiocView-class objects

dir A character vector giving the directory where the HTML files will be written.

backgroundColor

A character vector giving the background color for the body in the CSS file.

### Author(s)

Seth Falcon

# See Also

getBiocViews, genReposControlFiles, write\_VIEWS

writeHtmlDoc

Write an XML DOM containing HTML to a file

# Description

Given a DOM tree from the XML package and a filename, write the DOM to disk creating an HTML file.

# Usage

```
writeHtmlDoc(html, file)
```

# Arguments

html A DOM object from the XML package

file A string giving the filename

# Author(s)

S. Falcon

writePackageDetailHtml

Write HTML files for packages in a CRAN-style repository

# Description

This function creates package "homepages" that describe the package and provide links to download package artifacts in the repository.

# Usage

```
writePackageDetailHtml(pkgList, htmlDir = "html", backgroundColor="transparent")
```

writeRepositoryHtml 23

#### **Arguments**

pkgList A list of PackageDescription objects.

htmlDir The files will be written to this directory.

backgroundColor

A character vector giving the background color for the body in the CSS file.

#### Author(s)

Seth Falcon

#### See Also

writeRepositoryHtml

writeRepositoryHtml

Write package descriptions and a repository index as HTML

### **Description**

This function generates an HTML file for each package in a repository and generates an index.html file that provides an alphabetized listing of the packages.

#### Usage

### **Arguments**

reposRoot string specifying the path to the root of the CRAN-style package repository.

title string giving the title for the repository

reposUrl string giving the prefix for URL in links generated on the package description

pages. The default is "..." which works well if the package description HTML

files are written to an html subdirectory under the root of the repository.

viewUrl string giving the prefix for the URL in links to the view pages. The biocViews

terms will be linked to views summary pages with this prefix.

reposFullUrl string giving the full prefix for URL in links generated on the package descrip-

tion pages. The default is reposUr1.

downloadStatsUrl

string giving the prefix for the URL in links to the download history statistics

pages.

devHistoryUrl string giving the prefix for the URL in links to the development changelog.

link.rel logical indicating whether the index page should generate relative URL links.

The default is TRUE. If you are generating HTML for a remote repository, you

will want to set this to FALSE.

backgroundColor

A character vector giving the background color for the body in the CSS file.

# Author(s)

Seth Falcon

writeRFilesFromVignettes

Write R files from vignettes

# Description

Ensures that .R files from vignette code chunks are written out.

# Usage

# Arguments

reposRoot Root directory of a CRAN-style repository

reposUrl URL of repository
viewUrl url of VIEWS file

reposFullUrl Full URL of VIEWS file

downloadStatsUrl

URL to download stats page

devHistoryUrl Dev history URL

writeTopLevelView 25

writeTopLevelView	Write the view for the root of a vocabulary to disk

# **Description**

Given a directory and a vocabulary represented as a graphNEL containing a DAG of terms, write the top-level term to disk as HTML.

This assumes your vocabulary has a single term with no parents.

### Usage

```
writeTopLevelView(dir, vocab)
```

# **Arguments**

dir A string giving a directory in which to write the HTML file

vocab A graphNEL instance giving the DAG of terms. It should have a root node. That

is, there should be exactly one node with no incoming edges.

write_REPOSITORY	Write a REPOSITORY control file for a CRAN-style package reposi-
	tory

### **Description**

This function writes a REPOSITORY file at the top-level of a CRAN-style repository. This file is DCF formatted and describes the location of packages available in the repository. Here is an example for a repository containing only source and Windows binary packages:

```
source: src/contrib
win.binary: bin/windows/contrib/2.6
win64.binary: bin/windows64/contrib/2.6
mac.binary.leopard: bin/mac/leopard/contrib/2.6
provides: source, win.binary, win64.binary, mac.binary.leopard
```

### Usage

```
write_REPOSITORY(reposRootPath, contribPaths)
```

26 write\_SYMBOLS

# **Arguments**

reposRootPath character vector containing the path to the CRAN-style repository root directory.

 $contrib Paths \qquad A \ named \ character \ vector. \ Valid \ names \ are \ source, \\ win.binary, \\ win 64.binary,$ 

mac.binary, and mac.binary.leopard. Values indicate the paths to the pack-

age archives relative to the reposRoot.

write\_SYMBOLS

Write a SYMBOLS file

### **Description**

Writes a DCF formatted file, SYMBOLS, containing the symbols exported by each package in a directory containg R package source directories.

### Usage

```
write_SYMBOLS(dir, verbose = FALSE, source.dirs=FALSE)
```

# Arguments

dir The root of a CRAN-style package repository containing source packages. When

source.dirs is TRUE, dir should be a directory containing R package source

directories

verbose Logical. When TRUE, progress is printed to the standard output.

source.dirs Logical. When TRUE, interpret dir as a directory containing source package

directories. When FALSE, the default, dir is assumed to be the root of a CRANstyle package repository and the function will operate on the source package

tarballs in dir/src/contrib.

### Value

Returns NULL. Called for the side-effect of creating a SYMBOLS file in dir.

write\_PACKAGES write\_VIEWS

write\_VIEWS 27

write_VIEWS	Write a VIEWS control file for a CRAN-style package repository
-------------	--

# **Description**

This function writes a VIEWS file to the top-level of a CRAN-style package repository. The VIEWS file is in DCF format and describes all packages found in the repository.

The VIEWS file contains the complete DESCRIPTION file for each source package in the repository. In addition, metadata for available binary packages and vignettes is centralized here.

# Usage

# **Arguments**

reposRootPath fields	character vector containing the path to the CRAN-style repository root directory.  Any additional fields to include. You shouldn't need this, but if you have added fields to the DESCRIPTION files of the packages in the repository, you may want it.
type	One of source, win. binary, win64. binary, mac. binary, or mac. binary. leopard indicating which set of packages should be used to build up the "shared" information. Since a repository can contain different versions of the same package (source vs binary) the shared information may not be reliable.
verbose	logical, if TRUE, print progress messages.
vignette.dir	character specifying where to look for vignettes.

# Warning

This function uses a private function from the tools package: tools:::.build\_repository\_package\_db.
