Package 'mzR'

October 9, 2015

Type Package

Title parser for netCDF, mzXML, mzData and mzML and mzIdentML files (mass spectrometry data)

Version 2.2.2

Author Bernd Fischer, Steffen Neumann, Laurent Gatto, Qiang Kou

Maintainer Bernd Fischer < b. fischer@dkfz.de>,

Steffen Neumann < sneumann@ipb-halle.de>,

Laurent Gatto <1g390@cam.ac.uk>,

Qiang Kou <qkou@umail.iu.edu>

Description mzR provides a unified API to the common file formats and parsers available for mass spectrometry data. It comes with a wrapper for the ISB random access parser for mass spectrometry mzXML, mzData and mzML files. The package contains the original code written by the ISB, and a subset of the proteowizard library for mzML and mzIdentML. The netCDF reading code has previously been used in XCMS.

License Artistic-2.0

LazyLoad yes

Depends Rcpp (>= 0.10.1), methods, utils

Imports Biobase, BiocGenerics (>= 0.13.6), ProtGenerics

Description

The mzR package is a library purely for accessing mass spectrometry data in a wide range of formats. Several backend libraries are used, such as the ISB random access parser (RAMP) and ProteoWizard (pwiz) for mass spectrometry mzXML, mzData, mzML and mzid files. The package contains the original RAMP code written by the ISB, and a subset of the proteowizard library for mzML and mzid.

Details

Further information is available in the following vignette:

mzR mzR, Ramp, mzXML, mzData, mzML (source, pdf)

metadata 3

metadata

Access the metadata from an mzR object.

Description

Accessors to the analytical setup metadata of a run. runInfo will show a summary of the experiment as a named list, including scanCount, lowMZ, highMZ, dStartTime and dEndTime. The instrumentInfo method returns a named list including instrument manufacturer, model, ionisation technique, analyzer and detector. mzRpwiz will give more additional information including information on sample, software using and original source file. These individual pieces of information can also be directly accessed by the specific methods. mzidInfo is used for the mzR object created from a mzid file. It returns basic information on this mzid file including file provider, creation date, software, database, enzymes and spectra data format. The mzidInfo will return the scoring results in identification. It will return different results for different searching software used.

Usage

```
runInfo(object)
chromatogramsInfo(object)
analyzer(object)
detector(object)
instrumentInfo(object)
ionisation(object)
softwareInfo(object)
sampleInfo(object)
sourceInfo(object)
model(object)
mzidInfo(object)
modifications(object, ...)
psms(object, ...)
substitutions(object)
database(object, ...)
enzymes(object)
tolerance(object)
score(x, ...)
para(object)
```

Arguments

object An instantiated mzR object.x An instantiated mzR object.... Additional arguments, currently ignored.

4 mzR-class

See Also

See for example peaks to access the data for the spectra in a "mzR" class.

Examples

mzR-class

Class mzR and sub-classes

Description

The class mzR is the main class for the common mass spectrometry formats. It is a virtual class and thus not supposed to be instanciated directly.

The sub-classes implement specific APIs to access the underlying data and metadata in the files. Currently, mzRramp and mzRpwiz are available implementations. mzRramp uses the ISB 'RAMP' random access C/C++ API, and mzRpwiz uses Proteowizard to access the relevant information in mzData, mzXML and mzML files. You can also open mz5 file by using mzRpwiz.

Additional sub-classes using the proteowizard API and netCDF are planned.

Objects from the Class

mzR is a virtual class, so instances cannot be created.

Objects can be created by calls of the form new("mzRramp", ...), but more often they will be created with openMSfile.

After creating a mzR, you can write it into a file. mzXML, mzML, mgf formats are supported.

Slots

fileName: Object of class character storing the original filename used when the instance was created.

backend: One of the implemented backens or NULL.

.__classVersion__: Object of class "Versioned", from Biobase.

mzR-class 5

Extends

Class "Versioned", directly.

Examples

openMSfile 7

openMSfile	Create and check mzR objects from netCDF, mzXML, mzData or mzML files.

Description

The openMSfile constructor will create a new format-specifc mzR object, open 'filename' file and all header information is loaded as a Rcpp module and made accessible through the ramp or pwiz slot of the resulting object.

The openIDfile constructor will create a new format-specifc mzR object, open 'filename' file and all information is loaded as a Rcpp module. The mzid format is supported throught pwiz backend. Only mzIdentML 1.1 is supported.

Usage

```
openMSfile(filename, backend=c("Ramp", "pwiz", "netCDF"), verbose = FALSE)
initializeRamp(object)
isInitialized(object)
fileName(object, ...)
openIDfile(filename, verbose = FALSE)
```

Arguments

filename	Path name of the netCDF, mzData, mzXML or mzML file to read/write.
backend	A character specifiying with backend API to use. Currently 'Ramp', 'netCDF' and 'pwiz' are available.
object	An instantiated mzR object.
verbose	Enable verbose output.
	Additional arguments, currently ignored.

Author(s)

Steffen Neumann, Laurent Gatto, Qiang Kou

Examples

8 peaks

```
runInfo(mz)
close(mz)

## Not run:
    ## to use another backend
    mz <- openMSfile(file, backend = "pwiz")
    mz

## End(Not run)

file <- system.file("mzid", "Tandem.mzid.gz", package="msdata")
    mzid <- openIDfile(file)
    softwareInfo(mzid)
    enzymes(mzid)</pre>
```

peaks

Access the raw data from an mzR object.

Description

Access the MS raw data. The peaks and peaksCount functions return the (m/z,intensity) pairs and the number peaks in the spectrum/spectra. peaks returns a single matrix if scans is a numeric of length 1 and a list of matrices if several scans are asked for or no scans argument is provided (i.e all spectra in the oject are retured). peaksCount will return a numeric of length n.

The header function returns a list containing seqNum, acquisitionNum, msLevel, peaksCount, totIonCurrent, retentionTime, basePeakMZ, basePeakIntensity, collisionEnergy, ionisationEnergy, lowM, highMZ, precursorScanNum, precursorMZ, precursorCharge, precursorIntensity, mergedScan, mergedResultScanNum, mergedResultStartScanNum and mergedResultEndScanNum, when available in the original file. If multiple scans are queried, a data.frame is returned with the scans reported along the rows.

The get3Dmap function performs a simple resampling between lowMz and highMz with reMz resolution. A matrix of dimensions length(scans) times seq(lowMz,highMz,resMz) is returned.

Usage

```
header(object, scans, ...)
peaksCount(object, scans, ...)
peaks(object, ...)
get3Dmap(object, scans, lowMz, highMz, resMz, ...)
```

Arguments

object

An instantiated mzR object.

peaks 9

scans A numeric specifying which scans to return. Optional for the header, peaks

and peaksCount methods. If ommited, the requested data for all peaks is re-

turned.

lowMz, highMz Numerics defining the m/z range to be returned.

resMz a numeric defining the m/z resolution.

... Other arguments. A scan parameter can be passed to peaks.
