Package 'OmicsMarkeR'

April 23, 2016

Title Classification and Feature Selection for 'Omics' Datasets

Description Tools for classification and feature selection for 'omics' level datasets. It is a tool to provide multiple multivariate classification and feature selection techniques complete with multiple stability metrics and aggregation techniques. It is primarily designed for analysis of metabolomics datasets but potentially extendable to proteomics and transcriptomics applications.

Description

Compiles matrix of ranked features via user defined 'metric'

Usage

```
aggregation(efs, metric, f = NULL)
```

Arguments

efs A matrix of selected features

metric string indicating the type of aggregation. Avialable options are "CLA" (Complete

Linear), "EM" (Ensemble Mean), "ES" (Ensemble Stability), and "EE" (Ensem-

ble Exponential)

f The number of features desired. Default f = NULL

Value

agg Aggregated list of features

4 bagging.wrapper

Examples

```
# test data
ranks <- replicate(5, sample(seq(50), 50))
row.names(ranks) <- paste0("V", seq(50))
aggregation(ranks, "CLA")</pre>
```

bagging.wrapper

Bagging Wrapper for Ensemble Features Selection

Description

Compiles results of ensemble feature selection

Usage

```
bagging.wrapper(X, Y, method, bags, f, aggregation.metric, k.folds, repeats,
res, tuning.grid, optimize, optimize.resample, metric, model.features,
allowParallel, verbose, theDots)
```

Arguments

X A matrix containing numeric values of each feature

Y A factor vector containing group membership of samples

method A vector listing models to be fit bags Number of bags to be run

f Number of features desired

aggregation.metric

string indicating the type of ensemble aggregation. Avialable options are "CLA" (Complete Linear), "EM" (Ensemble Mean), "ES" (Ensemble Stability), and

"EE" (Ensemble Exponential)

k. folds Number of folds generated during cross-validation

repeats Number of times cross-validation repeated

res Optional - Resolution of model optimization grid

tuning.grid Optional list of grids containing parameters to optimize for each algorithm. De-

fault "tuning.grid = NULL" lets function create grid determined by "res"

optimize Logical argument determining if each model should be optimized. Default

"optimize = TRUE"

optimize.resample

Logical argument determining if each resample should be re-optimized. Default "optimize.resample = FALSE" - Only one optimization run, subsequent models use initially determined parameters

canberra 5

metric	Criteria for model optimization. Available options are "Accuracy" (Predication Accuracy), "Kappa" (Kappa Statistic), and "AUC-ROC" (Area Under the Curve - Receiver Operator Curve)
model.features	Logical argument if should have number of features selected to be determined by the individual model runs. Default "model.features = FALSE"
allowParallel	Logical argument dictating if parallel processing is allowed via foreach package. Default allowParallel = FALSE
verbose	Logical argument if should output progress
theDots	Optional arguments provided for specific models or user defined parameters if "optimize = FALSE".

Value

results List with the following elements:

• Methods: Vector of models fit to data

• ensemble.results: List of length = length(method) containing aggregated features

• Number.bags: Number of bagging iterations

• Agg.metric: Aggregation method applied

• Number.features: Number of user-defined features

bestTunes If "optimize.resample = TRUE" then returns list of best parameters for each

iteration

Author(s)

Charles Determan Jr

|--|

Description

Calculates canberra distance between two vectors. In brief, the higher the canberra distance the greater the 'distance' between the two vectors (i.e. they are less similar).

Usage

```
canberra(x, y)
```

Arguments

x numeric vector of ranks

y numeric vector of ranks with compatible length to x

6 canberra_stability

Value

Returns the canberra distance for the two vectors

Note

The canberra_stability function is used internally to return the canberra metric.

Author(s)

Charles E. Determan Jr.

References

Jurman G., Merler S., Barla A., Paoli S., Galea A., & Furlanello C. (2008) *Algebraic stability indicators for ranked lists in molecular profiling*. Bioinformatics 24(2): 258-264.

He. Z. & Weichuan Y. (2010) *Stable feature selection for biomarker discovery*. Computational Biology and Chemistry 34 215-225.

Examples

```
# Canberra demo
v1 <- seq(10)
v2 <- sample(v1, 10)
canberra(v1, v2)

canberra_stability(v1, v2)</pre>
```

canberra_stability

Canberra Stability

Description

Calculates canberra stability between two ranked lists. In brief, the raw canberra distance is scaled to a [0,1] distribution by the maximum canberra metric. Lastly, this value is subtracted from 1 to provide the same interpretation as the other stability metrics whereby 1 is identical and 0 is no stability.

Usage

```
canberra_stability(x, y)
```

Arguments

x numeric vector of ranks

y numeric vector of ranks with compatible length to x

CLA 7

Value

Returns the canberra stability for the two vectors

Author(s)

Charles E. Determan Jr.

References

Jurman G., Merler S., Barla A., Paoli S., Galea A., & Furlanello C. (2008) *Algebraic stability indicators for ranked lists in molecular profiling*. Bioinformatics 24(2): 258-264.

Examples

```
# Canberra demo
v1 <- seq(10)
v2 <- sample(v1, 10)
canberra(v1, v2)

canberra_stability(v1, v2)</pre>
```

CLA

Complete Linear Aggregation

Description

Compiles matrix of ranked features via complete linear aggregation

Usage

```
CLA(efs, f)
```

Arguments

efs A matrix of selected features

f The number of features desired. If rank correlation desired, f = NULL

Value

agg Aggregated list of features

Author(s)

Charles Determan Jr

8 create.corr.matrix

create.corr.matrix

Correlated Multivariate Data Generator

Description

Generates a matrix of dimensions dim(U) with induced correlations. Blocks of variables are randomly assigned and correlations are induced. A noise matrix is applied to the final matrix to perturb 'perfect' correlations.

Usage

```
create.corr.matrix(U, k = 4, min.block.size = 2, max.block.size = 5)
```

Arguments

U Numeric matrix

k Correlation Perturbation - The higher k, the more the data is perturbed. Default k = 4

min.block.size minimum number of variables to correlate Default min.block.size = 2

max.block.size maximum number of variables to correlate Default max.block.size = 5

Value

A numberic matrix of dimension dim(U) with correlations induced between variables

Note

Output does not contain classes, may provide externally as classes are irrelevant in this function.

# see ?create.corr.matrix for citation for methods
corr.mat <- create.corr.matrix(rand.mat)</pre>
# Induce Discriminatory Variables
# 10 discriminatory variables (D = 10)
# default discrimination level (l = 1.5)
# default number of groups (num.groups=2)
# default correlation purturbation (k = 4)
dat.discr <- create.discr.matrix(corr.mat, D=10)</pre>
```

create.discr.matrix Discriminatory Multivariate Data Generator

Description

Generates a matrix of dimensions dim(U) with induced correlations. D variables are randomly selected as discriminatory. If num.groups = 2 then discrimination is induced by adding and subtracting values derived from the level of of discrimination, 1, for the classes respectively. Multi-class datasets have a few further levels of randomization. For each variable, a random number of the groups are selected as discriminating while the remaining groups are not altered. For each discriminatory group, a unique change is provided by randomly assigning addition or subtraction of the discrimination factor. For example, if 3 groups are selected and two groups are assigned as addition and the third subtraction, the second addition is multiplied by its number of replicates. E.g. (1,1,-1)

10 create.discr.matrix

-> (1,2,-1). These values are randomized and then multiplied by the respective discrimination factor. The resulting values are then added/subtracted from the respective groups. A noise matrix is applied to the final matrix to perturb 'perfect' discrimination.

Usage

```
create.discr.matrix(V, D = 20, l = 1.5, num.groups = 2, k = 4)
```

Arguments

V	Numeric matrix
D	Number of discriminatory variables induced. Default D = 20
1	Level of discrimination, higher = greater separation. Default $1 = 1.5$
num.groups	Number of groups in the dataset
k	Correlation Perturbation - The higher k, the more the data is perturbed. Default
	k = 4

Value

List of the following elements

discr.mat Matrix of dimension dim(V)+1 with discriminatory variables induced and the

.classes added to the end of the matrix.

features Vector of features that were induced to be discriminatory.

corr.mat <- create.corr.matrix(rand.mat)

# Induce Discriminatory Variables

# 10 discriminatory variables (D = 10)
# default discrimination level (1 = 1.5)
# default number of groups (num.groups=2)
# default correlation purturbation (k = 4)

dat.discr <- create.discr.matrix(corr.mat, D=10)</pre>
```

create.random.matrix Random Multivariate Data Generator

Description

Generates a matrix of dimensions nvar by nsamp consisting of random numbers generated from a normal distribution. This normal distribution is then perturbed to more accurately reflect experimentally acquired multivariate data.

Usage

```
create.random.matrix(nvar, nsamp, st.dev = 1, perturb = 0.2)
```

Arguments

nvar	Number of features (i.e. variables)
nsamp	Number of samples
st.dev	The variation (i.e. standard deviation) that is typical in datasets of interest to the user. Default spread $= 1$
perturb	The amount of perturbation to the normal distribution. Default perturb = 0.2

Value

Matrix of dimension nvar by nsamp

denovo.grid

Denovo Grid Generation

Description

Greates grid for optimizing selected models

denovo.grid

Usage

```
denovo.grid(data, method, res)
```

Arguments

data of method to be tuned

method vector indicating the models to generate grids. Available options are "plsda"

(Partial Least Squares Discriminant Analysis), "rf" (Random Forest), "gbm" (Gradient Boosting Machine), "svm" (Support Vector Machines), "glmnet" (Elasticnet Generalized Linear Model), and "pam" (Prediction Analysis of Microarrays)

res Resolution of model optimization grid.

Value

A list containing dataframes of all combinations of parameters for each model:

Author(s)

Charles Determan Jr

See Also

"expand.grid" for generating grids of specific parameters desired. However, NOTE that you must still convert the generated grid to a list.

Examples

14 *EM*

ΕE

Ensemble Exponential Aggregation

Description

Compiles matrix of ranked features via ensemble exponential aggregation

Usage

```
EE(efs, f)
```

Arguments

efs A matrix of selected features

The number of features desired. If rank correlation desired, f = NULL

Value

agg Aggregated list of features

Author(s)

Charles Determan Jr

References

Haury A., Gestraud P., Vert J. (2011) *The Influence of Features Selection Methods on Accuracy, Stability, and Interpretability of Molecular Signatures*. PLoS ONE 6(12) e28210. doi: 10.1371/journal.pone.0028210

16 extract.features

See Also

CLA, EM, EE

extract.args Argument extractor

Description

Extract arguments from previously fs.stability models

Usage

```
extract.args(fs.model, method)
```

Arguments

fs.model Previously fit fs.stability model method Which model to extract from

Value

args List of model arguments

extract.features Feature Extraction

Description

Extracts features from models that have been previously fit.

Usage

```
extract.features(x, dat = NULL, grp = NULL, method,
  model.features = FALSE, bestTune = NULL, f, comp.catch = NULL)
```

Arguments

X	Previously	fitted model
^	1 1 C V I C U SI Y	IIIIIIIIIIIIIIIIIIIIIIIIIIIIIIIIIIIIII

dat Numeric variable data used for fitted models (In appropriate format)

grp Vector of training classes

method String indicating the INDIVIDUAL model being extracted from

model.features Logical argument dictating if features selected determined by models instead of

user determined number of features.

feature.table 17

bestTune If model.features = TRUE, must provide the parameter at which to extract

features from the model.

f Number of features to subset

comp. catch An internal check for plsda models. If the optimal model contains only 1 com-

ponent, the ncomp paramter must be set to 2 for the model. However, features

are still extracted only from the first component.

Value

Returns list of the features selected from the fitted model.

feature.table

Feature Consistency Table

Description

Extracts and sorts the features identified for a given method.

Usage

feature.table(features, method)

Arguments

features A fs. stability fitted object

method Algorithm of interest Available options are "plsda" (Partial Least Squares Dis-

criminant Analysis), "rf" (Random Forest), "gbm" (Gradient Boosting Machine), "svm" (Support Vector Machines), "glmnet" (Elastic-net Generalized

Linear Model), and "pam" (Prediction Analysis of Microarrays)

Value

A data frame containing:

features Features identified by model

consistency Number of iterations feature was identified

frequency Frequency of iterations the feature was identified

Author(s)

Charles Determan Jr

18 fit.only.model

Examples

```
dat.discr <- create.discr.matrix(</pre>
    create.corr.matrix(
        create.random.matrix(nvar = 50,
                               nsamp = 100,
                               st.dev = 1,
                               perturb = 0.2),
    D = 10
)
vars <- dat.discr$discr.mat</pre>
groups <- dat.discr$classes</pre>
fits <- fs.stability(vars,</pre>
                      groups,
                      method = c("plsda", "rf"),
                       f = 10,
                       k = 3,
                       k.folds = 10,
                       verbose = 'none')
feature.table(fits, "plsda")
```

fit.only.model

Fit Models without Feature Selection

Description

Applies models to high-dimensional data for classification.

Usage

```
fit.only.model(X, Y, method, p = 0.9, optimize = TRUE, tuning.grid = NULL,
  k.folds = if (optimize) 10 else NULL, repeats = if (optimize) 3 else NULL,
  resolution = if (optimize) 3 else NULL, metric = "Accuracy",
  allowParallel = FALSE, verbose = "none", ...)
```

Arguments

Χ	A scaled matrix or dataframe containing numeric values of each feature
Υ	A factor vector containing group membership of samples
method	A vector listing models to be fit. Available options are "plsda" (Partial Least Squares Discriminant Analysis), "rf" (Random Forest), "gbm" (Gradient Boosting Machine), "svm" (Support Vector Machines), "glmnet" (Elastic-net Generalized Linear Model), and "pam" (Prediction Analysis of Microarrays)
р	Percent of data to by 'trained'
optimize	Logical argument determining if each model should be optimized. Default "optimize = TRUE"

fit.only.model 19

tuning.grid	Optional list of grids containing parameters to optimize for each algorithm. Default "tuning.grid = NULL" lets function create grid determined by "res"
k.folds	Number of folds generated during cross-validation. Default "k.folds = 10"
repeats	Number of times cross-validation repeated. Default "repeats = 3"
resolution	Resolution of model optimization grid. Default "resolution = 3"
metric	Criteria for model optimization. Available options are "Accuracy" (Predication Accuracy), "Kappa" (Kappa Statistic), and "AUC-ROC" (Area Under the Curve - Receiver Operator Curve)
allowParallel	Logical argument dictating if parallel processing is allowed via foreach package. Default allowParallel = FALSE
verbose	Logical argument if should output progress
	Extra arguments that the user would like to apply to the models

Value

Methods Vector of models fit to data

performance Performance metrics of each model and bootstrap iteration

specs List with the following elements:

• total.samples: Number of samples in original dataset

• number.features: Number of features in orginal dataset

• number.groups: Number of groups

• group.levels: The specific levels of the groups

• number.observations.group: Number of observations in each group

Author(s)

Charles Determan Jr

Examples

20 fs.ensembl.stability

```
fs.ensembl.stability Ensemble Classification & Feature Selection
```

Description

Applies ensembles of models to high-dimensional data to both classify and determine important features for classification. The function bootstraps a user-specified number of times to facilitate stability metrics of features selected thereby providing an important metric for biomarker investigations, namely whether the important variables can be identified if the models are refit on 'different' data.

Usage

```
fs.ensembl.stability(X, Y, method, k = 10, p = 0.9,
    f = ceiling(ncol(X)/10), bags = 40, aggregation.metric = "CLA",
    stability.metric = "jaccard", optimize = TRUE,
    optimize.resample = FALSE, tuning.grid = NULL, k.folds = if (optimize)
    10 else NULL, repeats = if (k.folds == "LOO") NULL else if (optimize) 3 else
    NULL, resolution = if (optimize) 3 else NULL, metric = "Accuracy",
    model.features = FALSE, allowParallel = FALSE, verbose = "none", ...)
```

Arguments

Ë	guinents	
	Χ	A matrix containing numeric values of each feature
	Υ	A factor vector containing group membership of samples
	method	A vector listing models to be fit. Available options are "plsda" (Partial Least Squares Discriminant Analysis), "rf" (Random Forest), "gbm" (Gradient Boosting Machine), "svm" (Support Vector Machines), "glmnet" (Elastic-net Generalized Linear Model), and "pam" (Prediction Analysis of Microarrays)
	k	Number of bootstrapped interations
	p	Percent of data to by 'trained'
	f	Number of features desired. Default is top 10 "f = ceiling(ncol(variables)/10)". If rank correlation is desired, set "f = $NULL$ "
	bags	Number of iterations for ensemble bagging. Default "bags = 40"
	aggregation.met	ric
		String indicating which aggregation metric for features selected during bagging. Avialable options are "CLA" (Complete Linear), "EM" (Ensemble Mean), "ES" (Ensemble Stability), and "EE" (Ensemble Exponential)
	stability.metri	.c

string indicating the type of stability metric. Avialable options are "jaccard" (Jaccard Index/Tanimoto Distance), "sorensen" (Dice-Sorensen's Index), "ochiai" (Ochiai's Index), "pof" (Percent of Overlapping Features), "kuncheva" (Kuncheva's Stability Measures), "spearman" (Spearman Rank Correlation), and "canberra" (Canberra Distance)

fs.ensembl.stability 21

optimize Logical argument determining if each model should be optimized. Default "optimize = TRUE"

optimize.resample

Logical argument determining if each resample should be re-optimized. Default "optimize.resample = FALSE" - Only one optimization run, subsequent

models use initially determined parameters

Optional list of grids containing parameters to optimize for each algorithm. Detuning.grid

fault "tuning.grid = NULL" lets function create grid determined by "res"

Number of folds generated during cross-validation. May optionally be set to k.folds

"L00" for leave-one-out cross-validation. Default "k.folds = 10"

Number of times cross-validation repeated. Default "repeats = 3" repeats

Optional - Resolution of model optimization grid. Default "res = 3" resolution

metric Criteria for model optimization. Available options are "Accuracy" (Predication

Accuracy), "Kappa" (Kappa Statistic), and "AUC-ROC" (Area Under the Curve -

Receiver Operator Curve)

model.features Logical argument if should have number of features selected to be determined

by the individual model runs. Default "model.features = FALSE"

Logical argument dictating if parallel processing is allowed via foreach package. allowParallel

Default allowParallel = FALSE

verbose Character argument specifying how much output progress to print. Options are

'none', 'minimal' or 'full'.

Extra arguments that the user would like to apply to the models

Value

Methods Vector of models fit to data

Performance metrics of each model and bootstrap iteration performance RPT Robustness-Performance Trade-Off as defined in Saeys 2008

features List concerning features determined via each algorithms feature selection crite-

ria.

• metric: Stability metric applied

• features: Matrix of selected features

• stability: Matrix of pairwise comparions and average stability

stability.models

Function perturbation metric - i.e. how similar are the features selected by each

model.

all.tunes If "optimize.resample = TRUE" then returns list of optimized parameters for

each bagging and bootstrap interation.

final.best.tunes

If "optimize.resample = TRUE" then returns list of optimized parameters for

each bootstrap of the bagged models refit to aggregated selected features.

List with the following elements: specs

22 fs.stability

- total.samples: Number of samples in original dataset
- number.features: Number of features in orginal dataset
- number.groups: Number of groups
- group.levels: The specific levels of the groups
- number.observations.group: Number of observations in each group

verbose = 'none')
## End(Not run)</pre>
```

fs.stability

Classification & Feature Selection

Description

Applies models to high-dimensional data to both classify and determine important features for classification. The function bootstraps a user-specified number of times to facilitate stability metrics of features selected thereby providing an important metric for biomarker investigations, namely whether the important variables can be identified if the models are refit on 'different' data.

Usage

```
fs.stability(X, Y, method, k = 10, p = 0.9, f = NULL,
  stability.metric = "jaccard", optimize = TRUE,
  optimize.resample = FALSE, tuning.grid = NULL, k.folds = if (optimize)
  10 else NULL, repeats = if (k.folds == "LOO") NULL else if (optimize) 3 else
  NULL, resolution = if (is.null(tuning.grid) && optimize) 3 else NULL,
  metric = "Accuracy", model.features = FALSE, allowParallel = FALSE,
  verbose = "none", ...)
```

fs.stability 23

Arguments

X A scaled matrix or dataframe containing numeric values of each feature

Y A factor vector containing group membership of samples

method A vector listing models to be fit. Available options are "plsda" (Partial Least

Squares Discriminant Analysis), "rf" (Random Forest), "gbm" (Gradient Boosting Machine), "svm" (Support Vector Machines), "glmnet" (Elastic-net Gener-

alized Linear Model), and "pam" (Prediction Analysis of Microarrays)

k Number of bootstrapped interations

p Percent of data to by 'trained'

f Number of features desired. If rank correlation is desired, set "f = NULL"

stability.metric

string indicating the type of stability metric. Avialable options are "jaccard" (Jaccard Index/Tanimoto Distance), "sorensen" (Dice-Sorensen's Index), "ochiai" (Ochiai's Index), "pof" (Percent of Overlapping Features), "kuncheva" (Kuncheva's Stability Measures), "spearman" (Spearman Rank Correlation), and "canberra"

(Canberra Distance)

optimize Logical argument determining if each model should be optimized. Default

"optimize = TRUE"

optimize.resample

Logical argument determining if each resample should be re-optimized. Default "optimize.resample = FALSE" - Only one optimization run, subsequent

models use initially determined parameters

tuning grid Optional list of grids containing parameters to optimize for each algorithm. De-

fault "tuning.grid = NULL" lets function create grid determined by "res"

k.folds Number of folds generated during cross-validation. May optionally be set to

"L00" for leave-one-out cross-validation. Default "k.folds = 10"

repeats Number of times cross-validation repeated. Default "repeats = 3"

resolution Resolution of model optimization grid. Default "resolution = 3"

metric Criteria for model optimization. Available options are "Accuracy" (Predication

Accuracy), "Kappa" (Kappa Statistic), and "AUC-ROC" (Area Under the Curve -

Receiver Operator Curve)

model.features Logical argument if should have number of features selected to be determined

by the individual model runs. Default "model.features = FALSE"

allowParallel Logical argument dictating if parallel processing is allowed via foreach package.

Default allowParallel = FALSE

verbose Character argument specifying how much output progress to print. Options are

'none', 'minimal' or 'full'.

Extra arguments that the user would like to apply to the models

Value

Methods Vector of models fit to data

performance Performance metrics of each model and bootstrap iteration

24 fs.stability

RPT Robustness-Performance Trade-Off as defined in Saeys 2008

features List concerning features determined via each algorithms feature selection crite-

ria.

• metric: Stability metric applied

• features: Matrix of selected features

• stability: Matrix of pairwise comparions and average stability

stability.models

Function perturbation metric - i.e. how similar are the features selected by each model.

original.best.tunes

If "optimize.resample = TRUE" then returns list of optimized parameters for each bootstrap.

final.best.tunes

If "optimize.resample = TRUE" then returns list of optimized parameters for each bootstrap of models refit to selected features.

specs List with the following elements:

• total.samples: Number of samples in original dataset

• number.features: Number of features in orginal dataset

• number.groups: Number of groups

• group.levels: The specific levels of the groups

• number.observations.group: Number of observations in each group

Examples

jaccard 25

jaccard

Jaccard Index

Description

Calculates jaccard index between two vectors of features. In brief, the closer to 1 the more similar the vectors. The two vectors may have an arbitrary cardinality (i.e. don't need same length). Also known as the Tanimoto distance metric. Defined as the size of the vectors' intersection divided by the size of the union of the vectors.

Usage

```
jaccard(x, y)
```

Arguments

x vector of feature names y vector of feature names

Value

Returns the jaccard index for the two vectors. It takes values in [0,1], with 0 meaning no overlap between two sets and 1 meaning two sets are identical.

Examples

```
# Jaccard demo
v1 <- paste("Metabolite", seq(10), sep="_")
v2 <- sample(v1, 10)
jaccard(v1, v2)</pre>
```

kuncheva

Kuncheva's Index

Description

Calculates Kuncheva's index between two vectors of features. In brief, the closer to 1 the more similar the vectors. The two vectors must have the same cardinality (i.e. same length).

Usage

```
kuncheva(x, y, num.features)
```

Arguments

x Character vector of feature names
 y Character vector of feature names
 num. features
 total number of features in the original dataset

Value

Returns the Kuncheva Index for the two vectors. It takes values in [0,1], with 0 meaning no overlap between two sets and 1 meaning two sets are identical.

Note

The returned Kuncheva Index has been scaled from its original [-1,1] range to [0,1] in order to make it compatible with RPT.

Examples

```
# Kuncheva demo
# Assuming 50 metabolites were measured
# But only 10 were found significant

# For demonstration purposes only!!!
some.numbers <- seq(20)

# Metabolites identified from one run
v1 <- paste("Metabolite", sample(some.numbers, 10), sep="_")
# Metabolites identifed from second run
v2 <- paste("Metabolite", sample(some.numbers, 10), sep="_")
kuncheva(v1, v2, 50)</pre>
```

modelList

Model List

Description

Provide a list of currently implemented methods for OmicsMarkeR.

Usage

```
modelList()
```

Value

A data.frame containing:

methods The abbreviated code for the method

description Full name of the method

Author(s)

Charles Determan Jr.

Examples

```
modelList()
```

28 modelTuner

modelTuner	Model Tuner	

Description

Optimizes each model based upon the parameters provided either by the internal denovo.grid function or by the user.

Usage

```
modelTuner(trainData, guide, method, inTrain, outTrain, lev,
   savePredictions = FALSE, allowParallel = FALSE, verbose = "none",
   theDots = NULL)
```

Arguments

trainData	Data used to fit the model
guide	Output from tune.instructions. Facilitates the optimization by avoiding redundant model fitting.
method	Vector of strins listing models to be fit
inTrain	Indicies for cross-validated training models
outTrain	Indicies for cross-validated testing models
lev	Group levels
savePrediction	S
	Logical argument dictating if should save the prediction data. Default savePredictions = FALSE
allowParallel	Logical argument dictating if parallel processing is allowed via foreach package
verbose	Character argument specifying how much output progress to print. Options are 'none', 'minimal' or 'full'.
theDots	List of additional arguments provided in the initial classification and features selection function

Value

Returns list of fitted models

Author(s)

Charles E. Determan Jr.

modelTuner_loo 29

modelTuner_loo	Model Tuner for Leave-One-Out Cross-Validation	

Description

Optimizes each model via LOO CV based upon the parameters provided either by the internal denovo.grid function or by the user.

Usage

```
modelTuner_loo(trainData, guide, method, inTrain, outTrain, lev,
   savePredictions = FALSE, allowParallel = FALSE, verbose = "none",
   theDots = NULL)
```

Arguments

trainData	Data used to fit the model			
guide	Output from tune.instructions. Facilitates the optimization by avoiding redundant model fitting.			
method	Vector of strins listing models to be fit			
inTrain	Indicies for cross-validated training models			
outTrain	Indicies for cross-validated testing models			
lev	Group levels			
savePredictions				
	Logical argument dictating if should save the prediction data. Default savePredictions = FALSE			
allowParallel	Logical argument dictating if parallel processing is allowed via foreach package			
verbose	Character argument specifying how much output progress to print. Options are 'none', 'minimal' or 'full'.			

List of additional arguments provided in the initial classification and features

Value

theDots

Returns list of fitted models

selection function

Author(s)

Charles E. Determan Jr.

30 ochiai

noise.matrix

Noise Matrix Generator

Description

Provides a matrix to perturb randomly generated data to facilitate a more realistic dataset.

Usage

```
noise.matrix(matrix, k)
```

Arguments

matrix A matrix of simulated data with dimensions comparable to 'real' datasets k Correlation Perturbation - The higher k, the more the data is perturbed.

Value

Returns a matrix of the same dimensions as matrix that can add to perturb the original simulated data.

Author(s)

Charles E. Determan Jr.

ochiai

Ochiai's Index

Description

Calculates Ochiai's index between two vectors of features. In brief, the closer to 1 the more similar the vectors. The two vectors may have an arbitrary cardinality (i.e. don't need same length). Very similar to the Jaccard Index jaccard but Ochiai is a geometric means of the ratio.

Usage

```
ochiai(x, y)
```

Arguments

x Character vector of feature names y Character vector of feature names

Value

Returns the Ochiai Index for the two vectors. It takes values in [0,1], with 0 meaning no overlap between two sets and 1 meaning two sets are identical.

ochiai(v1, v2)</pre>
```

optimize.model

Model Optimization and Metrics

Description

Optimizes each model based upon the parameters provided either by the internal denovo.grid function or by the user.

Usage

```
optimize.model(trainVars, trainGroup, method, k.folds = 10, repeats = 3,
  res = 3, grid = NULL, metric = "Accuracy", allowParallel = FALSE,
  verbose = "none", theDots = NULL)
```

Arguments

trainVars	Data used to fit the model	
trainGroup	Group identifiers for the training data	
method	A vector of strings listing models to be optimized	
k.folds	Number of folds generated during cross-validation. Default "k.folds = 10"	
repeats	Number of times cross-validation repeated. Default "repeats = 3"	

res Resolution of model optimization grid. Default "res = 3"

grid Optional list of grids containing parameters to optimize for each algorithm. De-

fault "grid = NULL" lets function create grid determined by "res"

metric Criteria for model optimization. Available options are "Accuracy" (Predication

Accuracy), "Kappa" (Kappa Statistic), and "AUC-ROC" (Area Under the Curve -

Receiver Operator Curve)

allowParallel Logical argument dictating if parallel processing is allowed via foreach package

verbose Character argument specifying how much output progress to print. Options are

'none', 'minimal' or 'full'.

theDots List of additional arguments provided in the initial classification and features

selection function

Value

Basically a list with the following elements:

method Vector of strings listing models that were optimized performance Performance generated internally to optimize model

bestTune List of paramaters chosen for each model
dots List of extra arguments initially provided
metric Criteria that was used for model optimization
finalModels The fitted models with the 'optimum' parameters

performance.metrics

The performance metrics calculated internally for each resulting prediction

tune.metrics The results from each tune

perfNames The names of the performance metrics

comp. catch If the optimal PLSDA model contains only 1 component, the model must be refit

with 2 components. This catches the 1 component parameter so feature selection

and further performance analysis can be conducted on the 1 component.

Author(s)

Charles E. Determan Jr.

pairwise.model.stability

Pairwise Model Stability Metrics

Description

Conducts all pairwise comparisons of each model's selected features selected following bootstrapping. Also known as the function perturbation ensemble approach

Usage

```
pairwise.model.stability(features, stability.metric, nc)
```

Arguments

features A matrix of selected features stability.metric

string indicating the type of stability metric. Avialable options are "jaccard" (Jaccard Index/Tanimoto Distance), "sorensen" (Dice-Sorensen's Index), "ochiai" (Ochiai's Index), "pof" (Percent of Overlapping Features), "kuncheva" (Kuncheva's Stability Measures), "spearman" (Spearman Rank Correlation), and "canberra"

(Canberra Distance)

nc Number of original features

Value

A list is returned containing:

comparisons Matrix of pairwise comparisons

overall The average of all pairwise comparisons

Author(s)

Charles Determan Jr

References

He. Z. & Weichuan Y. (2010) *Stable feature selection for biomarker discovery*. Computational Biology and Chemistry 34 215-225.

```

pairwise.stability

Pairwise Stability Metrics

Description

Conducts all pairwise comparisons of features selected following bootstrapping. Also known as the data perturbation ensemble approach.

Usage

```
pairwise.stability(features, stability.metric, nc)
```

Arguments

features A matrix of selected features stability.metric

string indicating the type of stability metric. Available options are "jaccard" (Jaccard Index/Tanimoto Distance), "sorensen" (Dice-Sorensen's Index), "ochiai" (Ochiai's Index), "pof" (Percent of Overlapping Features), "kuncheva" (Kuncheva's Stability Measures), "spearman" (Spearman Rank Correlation), and "canberra"

(Canberra Distance)

nc Number of variables in original dataset

Value

A list is returned containing:

comparisons Matrix of pairwise comparisons

overall The average of all pairwise comparisons

Author(s)

Charles Determan Jr

params 35

Examples

```
# pairwise.stability demo

# For demonstration purposes only!!!
some.numbers <- seq(20)

# matrix of Metabolites identified (e.g. 5 trials)
features <- replicate(5, paste("Metabolite", sample(some.numbers, 10), sep="_"))
# nc may be omitted unless using kuncheva
pairwise.stability(features, "jaccard")</pre>
```

params

Model Parameters and Properties

Description

Provides a list of the models with their respective parameters and properties.

Usage

```
params(method = NULL)
```

Arguments

method

A vector of strings listing the models to be returned

Value

Returns a dataframe of the following components:

method A vector of strings listing models returned

parameter A vector of possible parameters to be optimized

label A vector of the names for each possible parameter

seq A logical indicator if the parameter is sequential in the model (i.e. if model is able to fit all 'lower' parameters simultaneously)

Examples

```
params("plsda")
```

36 performance.metrics

_		-
perf	~	3 I C
DEI I		3 T C

Performance Statistics Calculations

Description

Calculates confusion matrix and ROC statistics comparing the results of the fitted models to the observed groups.

Usage

```
perf.calc(data, lev = NULL, model = NULL)
```

Arguments

data dataframe of predicted (pred) and observed (obs) groups

lev Group levels

model String indicating which model was initially run

Value

Returns confusion matrix and ROC performance statistics including Accuracy, Kappa, ROC.AUC, Sensitivity, Specificity, Positive Predictive Value, and Negative Predictive Value

See Also

caret function confusionMatrix

performance.metrics

Performance Metrics of fs.stability or fs.ensembl.stability object

Description

This will provide a concise data.frame of confusion matrix and ROC statistics from the results of fs.stability or fs.ensembl.stability.

Usage

```
performance.metrics(fit.model, digits = max(3, getOption("digits") - 3))
```

Arguments

fit.model An fs.stability or fs.ensembl.stability object

digits How many digits to round values

performance.stats 37

Value

Dataframe of performance statistics by model

Author(s)

Charles E. Determan Jr.

Examples

```
dat.discr <- create.discr.matrix(</pre>
    create.corr.matrix(
        create.random.matrix(nvar = 50,
                               nsamp = 100,
                               st.dev = 1,
                               perturb = 0.2),
    D = 10
vars <- dat.discr$discr.mat</pre>
groups <- dat.discr$classes</pre>
fits <- fs.stability(vars,</pre>
                       groups,
                       method = c("plsda", "rf"),
                       f = 10,
                       k = 3,
                       k.folds = 10,
                       verbose = 'none')
performance.metrics(fits)
```

performance.stats

Performance Statistics (Internal for perf.calc)

Description

Calculates confusion matrix and ROC statistics comparing the results of the fitted models to the observed groups.

Usage

```
performance.stats(pred, obs)
```

Arguments

pred vector of groups predicted by a fitted classification model

obs vector of groups from the original dataset

38 perm.class

Value

Returns confusion matrix and ROC performance statistics including Accuracy, Kappa, ROC.AUC, Sensitivity, Specificity, Positive Predictive Value, and Negative Predictive Value

See Also

caret function confusionMatrix

perm.class

Monte Carlo Permutation of Model Performance

Description

Applies Monte Carlo permutations to user specified models. The user can either use the results from fs.stability or provide specified model parameters.

Usage

```
perm.class(fs.model = NULL, X, Y, method, k.folds = 5,
  metric = "Accuracy", nperm = 10, allowParallel = FALSE,
  create.plot = FALSE, verbose = TRUE, ...)
```

Arguments

fs.model	Object containing results from fs.stability
X	A scaled matrix or dataframe containing numeric values of each feature
Υ	A factor vector containing group membership of samples
method	A string of the model to be fit. Available options are "plsda" (Partial Least Squares Discriminant Analysis), "rf" (Random Forest), "gbm" (Gradient Boosting Machine), "svm" (Support Vector Machines), "glmnet" (Elastic-net Generalized Linear Model), and "pam" (Prediction Analysis of Microarrays)
k.folds	How many and what fractions of dataset held-out for prediction (i.e. $3 = 1/3$, $10 = 1/10$, etc.)
metric	Performance metric to assess. Available options are "Accuracy", "Kappa", and "ROC. AUC".
nperm	Number of permutations, default nperm = 10
allowParallel	Logical argument dictating if parallel processing is allowed via foreach package. Default allowParallel = FALSE
create.plot	Logical argument whether to create a distribution plot of permuation results.
verbose	Logical argument whether output printed automatically in 'pretty' format. Default create.plot = FALSE
	Extra arguments that the user would like to apply to the models

perm.features 39

Value

p.value

Resulting p-value of permuation test

Author(s)

Charles Determan Jr.

perm.class(fits, vars, groups, "rf", k.folds=5,
            metric="Accuracy", nperm=10)
```

perm.features

Feature Selection via Monte Carlo Permutation

Description

Applies Monte Carlo permutations to user specified models. The user can either use the results from fs.stability or provide specified model parameters.

Usage

```
perm.features(fs.model = NULL, X, Y, method, sig.level = 0.05, nperm = 10,
   allowParallel = FALSE, verbose = TRUE, ...)
```

40 perm.features

Arguments

fs.model Object containing results from fs.stability Χ A scaled matrix or dataframe containing numeric values of each feature Υ A factor vector containing group membership of samples method A vector listing models to be fit. Available options are "plsda" (Partial Least Squares Discriminant Analysis), "rf" (Random Forest), "gbm" (Gradient Boosting Machine), "svm" (Support Vector Machines), "glmnet" (Elastic-net Generalized Linear Model), and "pam" (Prediction Analysis of Microarrays) sig.level Desired significance level for features, default sig.level = .05 nperm Number of permutations, default nperm = 10 Logical argument dictating if parallel processing is allowed via foreach package. allowParallel Default allowParallel = FALSE verbose Logical argument whether output printed automatically in 'pretty' format.

Extra arguments that the user would like to apply to the models

Value

sig.level User-specified significance level
num.sig.features
Number of significant features
sig.features
Dataframe of significant features

Author(s)

Charles Determan Jr.

pof 41

```
method = c("plsda", "rf"),
    f = 10,
    k = 3,
    k.folds = 10,
    verbose = 'none')

# permute variables/features
perm.features(fits, vars, groups, "rf",
    sig.level = .05, nperm = 10)
```

pof

Percentage of Overlapping Features

Description

Calculates percent of overlapping features between two vectors of features. In brief, the closer to 1 the more similar the vectors. The two vectors may have an arbitrary cardinality (i.e. don't need same length).

Usage

```
pof(x, y)
```

Arguments

x Character vector of feature names

y Character vector of feature names

Value

Returns the percent of overlapping features for the two vectors. It takes values in [0,1], with 0 meaning no overlap between two sets and 1 meaning two sets are identical.

Author(s)

Charles E. Determan Jr.

References

```

predicting

Model Group Prediction

Description

This function evaluates a single fitted model and returns the predicted group memberships.

Usage

```
predicting(method, modelFit, orig.data, indicies, newdata, param = NULL)
```

Arguments

method	String of the model to be evaluated
modelFit	The fitted model being evaluated
orig.data	The original data before subsetting training sets. Required to have the 'observed' group membership
indicies	The indicies for the training subsets
newdata	The testing data to predict group membership
param	The parameters being fit to the model (Determined by model optimization).

Value

Returns a list of predicted group membership

prediction.metrics

Prediction Metric Calculations

Description

Performance evaluation of all fitted models. This function concisely provides model performance metrics, including confusion matrix and ROC.

Usage

```
prediction.metrics(finalModel, method, raw.data, inTrain, outTrain, features,
  bestTune, grp.levs, stability.metric)
```

predictNewClasses 43

Arguments

finalModel List of fitted models

method Vector of strings dictating the models that were fit

raw.data Original dataset prior to any training subset

inTrain List of training indicies for each feature selection run
outTrain List of testing data indicies for each feature selection run

features List of selected features for each model

bestTune List of parameters that have been optimized for the each respective model

grp.levs Vector of group levels

stability.metric

A character object specifying the stability metric

Value

Returns a dataframe consisting of each feature selection runs evaluated Accuracy, Kappa, ROC.AUC, Sensitivity, Specificity, Positive Predictive Value, and Negative Predictive Value.

See Also

performance.stats, perf.calc caret function confusionMatrix

predictNewClasses Class Prediction

Description

This function evaluates a single fitted model and returns the predicted group memberships of new data.

Usage

predictNewClasses(modelFit, method, orig.data, newdata, param = NULL)

Arguments

modelFit The fitted model being evaluated
method String of the model to be evaluated

orig.data The orginal data before subsetting training sets. Required to have the 'observed'

group membership

newdata The testing data to predict group membership

param Optional alternate parameters being fit to the model

44 RPT

Value

Returns a list of predicted group membership

Examples

```
dat.discr <- create.discr.matrix(</pre>
    create.corr.matrix(
        create.random.matrix(nvar = 50,
                              nsamp = 100,
                               st.dev = 1,
                               perturb = 0.2),
    D = 10
)
vars <- dat.discr$discr.mat</pre>
groups <- dat.discr$classes</pre>
fits <- fs.stability(vars,</pre>
                      groups,
                      method = c("plsda", "rf"),
                      f = 10,
                      k = 3,
                      k.folds = 10,
                      verbose = 'none')
newdata <- create.discr.matrix(</pre>
    create.corr.matrix(
        create.random.matrix(nvar = 50,
                              nsamp = 100,
                               st.dev = 1,
                               perturb = 0.2)),
    D = 10
)$discr.mat
orig.df <- data.frame(vars, groups)</pre>
# see what the PLSDA predicts for the new data
# NOTE, newdata does not require a .classes column
predictNewClasses(fits, "plsda", orig.df, newdata)
```

RPT

Robustness-Performance Trade-Off

Description

A variation on the F-measure (precision and recall) to assess robustness versus classification performance.

sequester 45

Usage

```
RPT(stability, performance, beta = 1)
```

Arguments

stability Stability metric i.e. result from jaccard, sorensen, etc.

performance e.g. accuracy

beta Relative of importance of stability versus performance. Default beta = 1 treats

stability and performance equally.

Value

Harmonic mean of robustness and classification performance

References

Examples

```
# RPT demo
RPT(stability=0.85, performance=0.90, beta=1)
```

sequester

Sequester Additional Parameters

Description

When the user provides additional arguments to either fs.stability or fs.ensembl.stability this function will extract the parameters to be fit if optimization is not used i.e. optimize = FALSE.

Usage

```
sequester(theDots, method)
```

Arguments

theDots List of additional arguments

method Vector of strings listing models to be fit

Value

Returns a list of the following elements

parameters The parameters that will be fit to models pnames The names of the specific parameters

46 sorensen

sorensen

Dice-Sorensen's Index

Description

Calculates Dice-Sorensen's index between two vectors of features. In brief, the closer to 1 the more similar the vectors. The two vectors may have an arbitrary cardinality (i.e. don't need same length). Very similar to the Jaccard Index jaccard but Dice-Sorensen is the harmonic mean of the ratio.

Usage

```
sorensen(x, y)
```

Arguments

x vector of feature namesy vector of feature names

Value

Returns the Dice-Sorensen's Index for the two vectors. It takes values in [0,1], with 0 meaning no overlap between two sets and 1 meaning two sets are identical.

Author(s)

Charles E. Determan Jr.

sorensen(v1, v2)</pre>
```

spearman 47

spearman

Spearman Rank Correlation Coefficient

Description

Calculates spearman rank correlation between two vectors

Usage

```
spearman(x, y)
```

Arguments

x numeric vector of ranks

y numeric vector of ranks with compatible length to x

Value

Returns the spearman rank coefficient for the two vectors

Examples

```
# Spearman demo
v1 <- seq(10)
v2 <- sample(v1, 10)
spearman(v1, v2)</pre>
```

svm.weights

SVM Multiclass Weights Ranking

Description

This calculates feature weights for multiclass Support Vector Machine (SVM) problems

Usage

```
## S3 method for class 'weights'
svm(model)
```

Arguments

model

A fitted SVM model of multiclass

Value

Vector of feature weights

svmrfeFeatureRanking SVM Recursive Feature Extraction (Binary)

Description

This conducts feature selection for Support Vector Machines models via recursive feature extraction. This returns a vector of the features in x ordered by relevance. The first item of the vector has the index of the feature which is more relevant to perform the classification and the last item of the vector has the feature which is less relevant. This function is specific to Binary classification problems,

Usage

```
svmrfeFeatureRanking(x, y, c, perc.rem = 10)
```

Arguments

X	A matrix where each column represents a feature and each row represents a sample
у	A vector of labels corresponding to each sample's group membership
С	A numeric value corresponding to the 'cost' applied during the svm model fitting. This can be selected by the user if using this function directly or is done internally.
perc.rem	A numeric value indicating the percent of features removed during each iteration. Default perc.rem = 10 .

Value

Vector of features ranked from most important to least important.

```

training

Model Training

Description

This fits each model with the defined parameters

Usage

```
training(data, method, tuneValue, obsLevels, theDots = NULL)
```

tune.instructions 51

Arguments

data Dataframe consisting of both numeric feature values and a single column named

'.classes' to denoted group membership.

method String dictating which model to fit

tuneValue List of parameters to be applied to the specific model

obsLevels Observed group levels

theDots List of additional parameters to be applied to the specific model

Value

fit Fitted model with list with the following elements:

• xNames: Names of the features

• tuneValue: Parameters applied to the fitted model

• obsLevels: Observed levels of the groups

Author(s)

Charles Determan Jr

tune.instructions Model Optimization Instructions

Description

Provides directions for which parameters to loop over during tuning. This becomes important when certain models can access 'lower' parameters without running them independently.

Usage

```
tune.instructions(method, grid)
```

Arguments

method Vector of strings indicating which models will be fit grid A list of parameters grids to be applied to the models

Value

modelInfo List of the following components

• scheme: String dictating which looping scheme to apply

- loop: Dataframe of parameters to loop through for each model
- model: Information regarding parameters of specific model
- constant: Names of the 'loop' dataframe components
- · vary: Indication of parameters that vary and can access recursively

52 tune.instructions
