# Package 'ExperimentHub'

April 14, 2017

Type Package

Title Client to access ExperimentHub resources	ient to access ExperimentHub resources	
uthor Bioconductor Package Maintainer <maintainer@bioconductor.org>  (aintainer Bioconductor Package Maintainer <maintainer@bioconductor.org>  (aintainer Bioconductor Package Maintainer <maintainer@bioconductor.org>  (aintainer Bioconductor Package provides a client for the Bioconductor  ExperimentHub web resource. ExperimentHub provides a central location where curated data from experiments, publications or training courses can be accessed. Each resource has associated metadata, tags and date of modification. The client creates and manages a local cache of files retrieved enabling quick and reproducible access.  (acense Artistic-2.0)  (acense Artistic-2.0)  (becviews Infrastructure, DataImport, GUI, ThirdPartyClient epends methods, BiocGenerics (&gt;= 0.15.10), AnnotationHub (&gt;= 2.5.9)  (apports utils, S4Vectors, BiocInstaller angests knitr, BiocStyle</maintainer@bioconductor.org></maintainer@bioconductor.org></maintainer@bioconductor.org>

ExperimentHub-objects ExperimentHub objects and their related methods and functions		

#### **Description**

Use ExperimentHub to interact with Bioconductor's ExperimentHub service. Query the instance to discover and use resources that are of interest, and then easily download and import the resource into R for immediate use.

Use ExperimentHub() to retrieve information about all records in the hub.

Discover records in a hub using mcols(), query(), subset(), [, and display().

Retrieve individual records using [[. On first use of a resource, the corresponding files or other hub resources are downloaded from the internet to a local cache. On this and all subsequent uses the files are quickly input from the cache into the R session.

ExperimentHub records can be added (and sometimes removed) at any time. snapshotDate() restricts hub records to those available at the time of the snapshot; use possibleDates() to see possible snapshot dates.

The location of the local cache can be found (and updated) with getExperimentHubCache and setExperimentHubCache; removeCache removes all cache resources.

#### **Constructors**

ExperimentHub(..., hub=getExperimentHubOption("URL"), cache=getAnnotationHubOption("CACHE' Create an ExperimentHub instance, possibly updating the current database of records.

#### Accessors

In the code snippets below, x and object are ExperimentHub objects.

hubCache(x): Gets the file system location of the local ExperimentHub cache.

hubUrl(x): Gets the URL for the online hub.

length(x): Get the number of hub records.

names(x): Get the names (ExperimentHub unique identifiers, of the form AH12345) of the hub records.

fileName(x): Get the file path of the hub records as stored in the local cache (ExperimentHub files are stored as unique numbers, of the form 12345). NA is returned for those records which have not been cached.

package(x): Returns a named character vector of package name associated with the hub resource.

recordStatus(x, record): Returns a data.frame of the record id and status. x must be a Hub object and record must be a character(1). Can be used to discover why a resource was removed from the hub.

mcols(x): Get the metadata columns describing each record. Columns include:

title Record title, frequently the file name of the object.

dataprovider Original provider of the resource, e.g., Ensembl, UCSC.

species The species for which the record is most relevant, e.g., 'Homo sapiens'.

taxonomyid NCBI taxonomy identifier of the species.

**genome** Genome build relevant to the record, e.g., hg19.

**description** Textual description of the resource, frequently automatically generated from file path and other information available when the record was created.

tags Single words added to the record to facilitate identification, e.g., TCGA, Roadmap.

**rdataclass** The class of the R object used to represent the object when imported into R, e.g., GRanges, VCFFile.

sourceurl Original URL of the resource.

sourectype Format of the original resource, e.g., BED file.

#### Subsetting and related operations

In the code snippets below, x is an ExperimentHub object.

- x\$name: Convenient reference to individual metadata columns, e.g., x\$species.
- x[i]: Numerical, logical, or character vector (of ExperimentHub names) to subset the hub, e.g., x[x\$species == "Homo sapiens"].
- x[[i]]: Numerical or character scalar to retrieve (if necessary) and import the resource into R.
- query(x, pattern, ignore.case=TRUE, pattern.op= `&`): Return an ExperimentHub subset containing only those elements whose metadata matches pattern. Matching uses pattern as in grep1 to search the as.character representation of each column, performing a logical `&` across columns. e.g., query(x, c("Homo sapiens", "hg19", "GTF")).
  - pattern A character vector of patterns to search (via grepl) for in any of the mcols() columns.
  - ignore.case A logical(1) vector indicating whether the search should ignore case (TRUE) or not (FALSE).
  - pattern.op Any function of two arguments, describing how matches across pattern elements are to be combined. The default `&` requires that only records with *all* elements of pattern in their metadata columns are returned.
- subset(x, subset): Return the subset of records containing only those elements whose metadata
   satisfies the expression in subset. The expression can reference columns of mcols(x), and
   should return a logical vector of length length(x). e.g., subset(x, species == "Homo sapiens" &
   genome="GRCh38").
- display(object): Open a web browser allowing for easy selection of hub records via interactive tabular display. Return value is the subset of hub records identified while navigating the display.
- listResources(hub, package, filterBy=character()): List resources in ExperimentHub associated with package. filterBy is a character vector of search terms.
- loadResources(hub, package, filterBy=character()): Load resources in ExperimentHub associated with package. filterBy is a character vector of search terms.

#### Cache and hub management

In the code snippets below, x is an ExperimentHub object.

- snapshotDate(x) and snapshotDate(x) <- value: Gets or sets the date for the snapshot in
  use. value should be one of possibleDates().</pre>
- possibleDates(x): Lists dates for snapshots that the hub could potentially use.
- cache(x) and cache(x) <- NULL: Adds (downloads) all resources in x, or removes all local resources corresponding to the records in x from the cache. In this case, x would typically be a small subset of ExperimentHub resources.
- hubUrl(x): Gets the URL for the online ExperimentHub.
- hubCache(x): Gets the file system location of the local ExperimentHub cache.
- removeCache(x): Removes local ExperimentHub database and all related resources. After calling this function, the user will have to download any ExperimentHub resources again.
- getExperimentHubOption(): TODO: Get cache options "CACHE", "URL", "MAXDOWN-LOADS" ...
- ${\tt setExperimentHubOption(): TODO: Set cache options "CACHE", "URL", "MAXDOWNLOADS"}$

#### Coercion

In the code snippets below, x is an ExperimentHub object.

as.list(x): Coerce x to a list of hub instances, one entry per element. Primarily for internal use. c(x, ...): Concatenate one or more sub-hub. Sub-hubs must reference the same ExperimentHub instance. Duplicate entries are removed.

#### **Examples**

## TODO:

getExperimentHubOption

Get and set options for default ExperimentHub behavior.

#### **Description**

These functions get or set options for creation of new 'ExperimentHub' instances.

#### Usage

```
getExperimentHubOption(arg)
setExperimentHubOption(arg, value)
```

## **Arguments**

arg The character(1) hub options to set. see 'Details' for current options.

value The value to be assigned to the hub option.

## **Details**

Supported options include:

- "URL": character(1). The base URL of the Experiment Hub. Default: https://experimenthub.bioconductor.org
- "CACHE": character(1). The location of the hub cache. Default: ".ExperimentHub" in the user home directory.
- "MAX\_DOWNLOADS": numeric(1). The integer number of downloads allowed before triggering an error. This is to help avoid accidental download of a large number of ExperimentHub members.
- **"PROXY":** request object returned by httr::use\_proxy(). The request object describes a proxy connection allowing Internet access, usually through a restrictive firewall. Setting this option sends all ExperimentHub requests through the proxy. Default: NULL.

In setHubOption("PROXY", value), value can be one of NULL, a request object returned by httr::use\_proxy(), or a well-formed URL as character(1). The URL can be completely specified by http://username:password@proxy.dom.com:8080; username:password and port (e.g. :8080) are optional.

Default values may also be determined by system and global R environment variables visible *be-fore* the package is loaded. Use options or variables preceded by "EXPERIMENT\_HUB\_", e.g., options(EXPERIMENT\_HUB\_MAX\_DOWNLOADS=10) prior to package load sets the default number of downloads to 10.

#### Value

The requested or successfully set option.

# **Examples**

```
getExperimentHubOption("URL")
## Not run:
setExperimentHubOption("CACHE", "~/.myHub")
## End(Not run)
```
