## 1 Overview

In genomic era, genome-scale experiments and data analyses require genes to be annotated from different sources, an R R Development Core Team (2008) package AnnBuilder was developped for this purpose Zhang et al. (2003). In post genomic era, advances in proteomics highlight the urgence of understanding protein language Jensen (2006). However, relative to genes, AnnBuilder is limited in protein annotation due to the complexity of proteins caused by 3-D strucutre, alternative splicing, modification, dynamic location and other features. The package PAnnBuilder focuses on assembling proteomic annotation data, which should be very useful for proteomic data interpretation. It not only inherits the good features of AnnBuilder such as automatically parsing protein annotation data and building R packages from selected sources, but also emphasizes specific features of proteins. PAnnBuilder currently supports 16 databases involving diverse aspects of proteomics, such as protein primary data, protein domain/family, subcellular location, protein interaction, post-translational modifications, body fluid proteomics, homolog/ortholog groups and so on. Additionally, PAnnBuilder allows annotation to unknown proteins based on sequence similarities to other well-annotated proteins. To extend the use of PAnnBuilder, 54 standard R annotation packages are produced from main protein databases, which are freely available for download via biocLite.

## 2 Getting Started

### 2.1 Requirements

PAnnBuilder requires the support from the following items:

- 1. For PAnnBuilder  $\geq 1.3.0$ , R  $\geq 2.7.0$  is needed for building SQLite-based package. Dependent R packages are needed to be installed: *methods*, *utils*, *RSQLite*, *Biobase* ( $\geq 1.17.0$ ), *AnnotationDbi* ( $\geq 1.3.12$ ). If you use the installation script "PAnnBuilder.R" to install PAnnBuilder ( $\geq 1.3.0$ ), it will automatically check these dependent packages and install missing packages from CRAN or Bioconductor.
- 2. Rtools is needed for Windows user. The matched version of Rtools with R can be downloaded via http://www.murdoch-sutherland.com/Rtools/.
- 3. Perl is required to parse the rather large annotation source data files. It can be down-loaded from http://www.perl.com/download.csp.
- Program formatdb and BLASTP is needed for function crossBuilder, crossBuilder\_DB, pSeqBuilder, pSeqBuilder\_DB.
   BLAST can be downloaded from http://www.ncbi.nlm.nih.gov/BLAST/download.shtml.

Note: It is better to have enough space for the temporary directory. The path of the persession temporary directory can be acquired by:

- > tempdir()
- [1] "/tmp/RtmpIN8EVI"

### 2.2 Installation

The biocLite script is used to install PAnnBuilder from within R:

```
> source("http://bioconductor.org/biocLite.R")
> biocLite("PAnnBuilder")
```

#### > library(PAnnBuilder)

Note: Web Connection is needed to install PAnnBuilder and its depended packages.

### 2.3 Public Data Sources

PAnnBuilder parses proteomics annotation data from public sources and build R annotation packages. It also provides convenient functions to access these sources. For example, you can get all supported databases for "Homo sapiens" by:

>	library(PAnnBuilder)	## Load package
>	getALLUrl("Homo sapiens")	## Get urls
>	<pre>getALLBuilt("Homo sapiens")</pre>	<pre>## Get version/release</pre>

Detail description of all supported public data sources in PAnnBuilder are as follows:

- UniProt The data ftp://ftp.ebi.ac.uk/pub/databases/uniprot/knowledgebase will be used to map protein UniProt identifiers to diverse annotation available in UniProt database.
- **IPI** The data ftp://ftp.ebi.ac.uk/pub/databases/IPI/current will be used to map protein IPI identifiers to diverse annotation available in International Protein Index database.
- **RefSeq** The data ftp://ftp.ncbi.nih.gov/refseq will be used to map protein RefSeq identifiers to diverse annotation available in NCBI RefSeq database.
- Entrez Gene The data ftp://ftp.ncbi.nih.gov/gene/DATA will be used to annotate genes after the Entrez Gene identifiers have been obtained.
- Gene Ontology The data ftp://ftp.ebi.ac.uk/pub/databases/GO/goa/proteomes and http://archive.geneontology.org/latest-termdb will be used to obtain gene on-tology information.
- **KEGG** Some data at ftp://ftp.genome.jp/pub/kegg will be used to obtain pathway information.

- HomoloGene A data file provided by ftp://ftp.ncbi.nlm.nih.gov/pub/HomoloGene/ current/ will be used to extract mappings between GeneID/ProteinGI and Homolo-Gene ids.
- InParanoid The data http://inparanoid.sbc.su.se will be used to obtain ortholog protein groups between two organisms.
- Gene Interaction The data ftp://ftp.ncbi.nih.gov/gene/GeneRIF will be used to extract protein-protein interactions between Entrez GeneID or Protein RefSeq ids.
- IntAct The data ftp://ftp.ebi.ac.uk/pub/databases/intact/current/psimitab will be used to extract protein-protein interactions between UniProt protein accession numbers.
- **MPPI** The data http://mips.gsf.de/proj/ppi/data/mppi.gz will be used to extract protein-protein interactions between UniProt protein accession numbers.
- **3DID** The data http://gatealoy.pcb.ub.es/3did/download will be used to extract domaindomain interactions between Pfam domain identifiers.
- **DOMINE** The data http://domine.utdallas.edu will be used to extract domain-domain interactions between Pfam domain identifiers.
- DBSubLoc The data http://www.bioinfo.tsinghua.edu.cn/~guotao will be used to obtain subcellular localization for protein from SWISS-PROT and PIR database.
- BaCelLo The data http://gpcr2.biocomp.unibo.it/bacello will be used to map SwissProt eukaryotes protein identifiers to subcellular localization.
- **SCOP** The data http://scop.mrc-lmb.cam.ac.uk/scop will be used to map PDB structure identifiers to SCOP domain identifiers.
- **PeptideAtlas** The data http://www.peptideatlas.org/builds will be used to obtain experimentally identified peptides and their coordinates on chromosomes.
- **SysPTM** The data http://www.biosino.org/papers/SysPTM will be used to obtain protein post-translational modifications information.
- Sys-BodyFluid The data http://www.biosino.org/papers/Sys-BodyFluid will be used to map IPI protein identifiers to body fluids.

### 2.4 Annotation Packages Produced by PAnnBuilder

#### 2.4.1 Packages produced by PAnnBuilder

PAnnBuilder has powerful ability to build R package for assembling proteome annotation. However, the process of building new package may be time-consuming because of the downloading and parsing of large data files. To make PAnnBuilder useful for any users, we have built many frequently used annotation packages in advance. These pre-built package can be downloaded via biocLite.

These packages are divided into two classes: environment-based packages built by "\*Builder" functions (see Table ??); SQLite based packages built by "\*Builder\_DB" functions (see Table 1). They are widely used methods for building Bioconductor meta-data packages. Each SQLite-based annotation package (identified by a ".db" suffix in the package name) contains a number of AnnDbBimap objects in place of the environment objects found in the old-style environment-based annotation packages. In future, SQLite-based annotation package will replace environment-based packages.

The pre-built packages provide a quick start for R beginners. If one wants to analyze protein set in Human IPI database, the quickest way is to download and use SQLite based package "org.Hs.ipi.db". However, if the package one wants has not been built or a new-version database is released, new package should be built using functions in PAnnBuilder (See Section 4 for methods of building annotation packages).

#### 2.4.2 Using annotation data package

SQLite-based \*.db packages are capable of flexible data queries, reverse mapping, and data filtering. Vignette of "AnnotationDbi" detailedly described how to use SQLite based packages (http://www.bioconductor.org/packages/release/bioc/vignettes/AnnotationDbi/inst/doc/AnnotationDbi.pdf). Here package "org.Hs.ipi.db" produced by PAnnBuilder is illustrated as an example in the following code chuck.

1. Install and load annotation package. Package "org.Hs.ipi" is used as an example, other packages can be derived accordingly.

```
> biocLite("org.Hs.ipi.db")
```

- > library(org.Hs.ipi.db) # Load annotation package
- 2. Browse data in the package.

> ?org.Hs.ipiGENEID

3. Convert the environment object into a "list" object, and get values by index or name.

```
> xx <- as.list(org.Hs.ipiGENEID)
> xx[!is.na(xx)][1:3]
$IPI00000001.2
[1] "6780"
$IPI00000005.1
[1] "4893"
```

## **3** Function Description

#### 3.1 Getting URL and Version

To download data file from public database, the first step is getting its URL and release/version information. URLs of supported databases are stored in "data/sourceURLs.txt". Following functions are used to get the url:

- getSrcUrl return url according given database.
- getALLUrl return urls for all databases used in PAnnBuilder packages.

- getSrcBuilt return release/version according given database.
- getALLBuilt return release/version information for all databases used in PAnnBuilder packages.

## 3.2 Parsing and Writing Data

Parsing is a key step to convert original data file to R object. Sometimes R is directly used to parse and write data. But for large data file or complicated data format, perl is firstly employed to quickly process data, and then R function reads the result file into R objects.

### 3.2.1 Employing perl program to parse data

Segment of perl program is written into file in "inst/scripts". Name and function of these parser files are as follows:

- spParser parse protein data from SwissProt or TrEMBL
- ipiParser parse protein data from IPI
- refseqParser parse protein data from NCBI RefSeq
- equalParser find protein ID mapping with equal sequences
- mergeParser merge different ID mapping files
- mppiParser parse protein protein interaction data from MIPS
- paParser parse data from PeptideAtlas
- dbsublocParser parse data from DBSubLoc
- pfamNameParser parse domain id and name from Pfam
- blastParser filter the results of blast

Function fileMuncher and fileMuncher\_DB perl file based on given parser file and additional input data file, then perform this perl program via R.

### 3.2.2 Writing data using R

Besides using perl program, R functions also parse data from simple data file and store them as R environment objects or Bimap objects.

- createEmptyDPkg create an empty R packge at given directory.
- writeSQ write sequence data into R package.

- writeName parse mulitple data file, and write the mapping of id and name into R package. It employs writeGOName, writeKEGGName, writePFAMName, writeINTERPROName and writeTAXName to respectively write data from GO, KEGG, Pfam, InterPro and TAX.
- writeSCOPData parse structural classification of proteins from SCOP database.
- writeSubCellData parse data from protein subcellular location databases, and write into R package. It employs writeBACELLOData and writeDBSUBLOCData to respectively write data from BaCelLo and DBSubLoc.
- writeIntData parse data from protein-protein/domain-domain interaction databases, and write into R package. It employs writeGENEINTData, writeINTACTData, writeMP-PIData, write3DIDData and writeDOMINEData to respectively write data from NCBI gene interaction data file, EBI intact, MIPS interaction data, 3DID database and DOMINE database.
- writePtmData parse database involving protein post-translational modifications, and write into R package. It employs writeSYSPTMData to write data from SysPTM database.
- writeBfData write data involving body fulids proteomics into R package. It employs writeSYSB0DYFLUIDData to write data from Sys-BodyFluid database.
- writeGOAData write gene ontology terms from GOA database into R package.
- writeHomoloGeneData write homolog groups from NCBI HomoloGene into R package.
- writeInParanoidData write paralog groups from InParanoid into R package.
- writePeptideAtlasData write peptides identified by Mass Spectrometry from PeptideAtlas database into R package.
- writeMeta\_DB write meta information about the annotation package into SQLite-based package.
- writeData\_DB parse data from databases, and write data as tables into SQLite-based R package. It employs writeSPData\_DB, writeIPIData\_DB, writeREFSEQData\_DB, writeGENEINTData\_DB, writeINTACTData\_DB, writeMPPIData\_DB, write3DIDData\_DB, writeSYSBODYFLUIDData\_DB, writeSYSPTMData\_DB, writeSCOP-Data\_DB, writeBACELLOData\_DB, writeDBSUBLOCData\_DB, writeGOAData\_DB, write-HomoloGeneData\_DB, writeInParanoidData\_DB, and writePeptideAtlasData\_DB to respectively write data from Swiss-Prot, IPI, NCBI RefSeq database, and so on.

- writeName\_DB parse mulitple data file, and write the mapping of id and name into SQLite-based R package. It employs writeGOName\_DB, writeKEGGName\_DB, writeP-FAMName\_DB, writeINTERPROName\_DB and writeTAXName\_DB to respectively write data from GO, KEGG, Pfam, InterPro and TAX.
- createSeeds define a list of AnnDbBimap objects which indicates key and value of .
- createAnnObjs produce AnnDbBimap objects based on the definiation in create-Seeds.

### 3.3 Writing Help Documents

Help documents is an important part for new package. Diverse templates of help documents are stored in the "inst/templates" directory. When building new package, R functions use these templates to create "\*.rd" help file in the "man" directory:

- getRepList return a list which will replace the symbols in template file.
- copyTemplates\_DB implement similar function with copyTemplates, and is specially developed for SQLite-based annotation package.
- writeDescription\_DB implement similar function with writeDescription, and is specially developped for SQLite-based annotation package.

### 3.4 Building Data Packages

Basic functions described above make it possible to build proteomic annotation data packages. Based on these, PAnnBuilder develops multiple sophisticated functions to assemble proteomic annotaion data. Each function is implemented by the "\*Builder\_DB" R function.

- pBaseBuilder\_DB build annotation data packages for primary protein database such as SwissProt, TREMBL, IPI or NCBI RefSeq protein data.
- pSeqBuilder\_DB build annotation data packages for query protein sequences based on sequence similarity.
- crossBuilder\_DB build annotation data packages for protein id mapping in SwissProt, Trembl, IPI and NCBI Refseq databases.
- **subcellBuilder\_DB** build annotation data packages for protein subcellular location from BaCelLo or DBSubLoc database.
- HomoloGeneBuilder\_DB build annotation data packages for homolog protein group from NCBI HomoloGene database.
- InParanoidBuilder\_DB build annotation data packages for ortholog protein group between two given organisms from InParanoid database.

- GOABuilder\_DB build annotation data packages for mapping proteins of UniProt to Gene Ontolgy from GOA database.
- **scopBuilder\_DB** build annotation data packages for Structural Classification of Proteins.
- intBuilder\_DB build annotation data packages for protein-protein or domain-domain interaction from IntAct, MPPI, 3DID, DOMINE or NCBI Gene interaction database.
- PeptideAtlasBuilder\_DB build annotation data packages for experimentally identified peptides from PeptideAtlas database.
- ptmBuilder\_DB build annotation data packages for post-translational modifications from SysPTM database.
- **bfBuilder\_DB** build annotation data packages for proteins in body fluids from Sys-BodyFluid database.
- dNameBuilder\_DB build annotation data packages for mapping between entry ID and name from GO, KEGG, Pfam, InterPro and NCBI Taxonomy databases.

## 4 Building Annotation Data Packages

1. The first thing you need to do is setting basic parameters such as "pkgpath", "version", and "author".

```
> # Set path, version and author for the package.
> library(PAnnBuilder)
> pkgPath <- tempdir()
> version <- "1.0.0"
> author <- list()
> author[["authors"]] <- "Hong Li"
> author[["maintainer"]] <- "Hong Li <sysptm@gmail.com>"
```

- 2. Then you can run diverse "\*Builder\_DB" functions to build packages by yourselves. pBaseBuilder\_DB, subcellBuilder\_DB, and pSeqBuilder\_DB are taken as examples to build annotation packages.
  - pBaseBuilder\_DB builds annotation data packages for proteins in three primary protein databases (SwissProt, IPI, RefSeq). It is a convenient way to obtain complete and canonical annotaion, including protein description, Entrez gene identifier, KEGG pathway, gene ontology, domain, coordinates on chromosomes and so on. For example, if you want to build annotation package for Mouse IPI database, you can use codes as follows:

```
> ## Build SQLite based annotation package "org.Mm.ipi.db"
> ## for Mouse IPI database.
> ## Note: Perl is needed for parsing data file.
> ## Rtools is needed for Windows user.
> pBaseBuilder_DB(baseMapType = "ipi", organism = "Mus musculus",
+ prefix = "org.Mm.ipi", pkgPath = pkgPath, version = version
+ author = author)
```

After running, a subdirectory called "org.Mm.ipi" will be produced in the path given by "pkgPath". This directory contains all data and files, which can be used to build R package by "R CMD build" command.

**subcellBuilder\_DB** builds annotation data Package which provides protein subcellular location information.

```
>
  ## Build subcellular location annotation package "sc.bacello.db"
>
  ## from BaCelLo database.
>
  subcellBuilder_DB(src="BaCelLo", prefix="sc.bacello",
                  pkgPath, version, author)
+
   ## List all files in created directory "sc.bacello.db".
>
    dir(file.path(pkgPath, "sc.bacello.db"))
>
                                "R"
[1] "DESCRIPTION" "NAMESPACE"
                                              "inst"
                                                            "man"
```

pSeqBuilder\_DB uses blast to calculate sequence similarity between query proteins and subject proteins, then assign annotation for query protein according to existing annotation of its similar proteins. pSeqBuilder\_DB is useful for proteins which have not well annotated. Following code chunk gives an example for annotation query proteins by pSeqBuilder\_DB. Needed R packages org.Hs.sp.db, org.Hs.ipi.db, can be downloaded via biocLite.

```
> ## Read query sequence.
> tmp = system.file("extdata", "query.example", package="PAnnBuilder")
> tmp = readLines(tmp)
> tag = grep("^>",tmp)
> query <- sapply(1:(length(tag)-1), function(x){</pre>
       paste(tmp[(tag[x]+1):(tag[x+1]-1)], collapse="") })
> query <- c(query, paste(tmp[(tag[length(tag)]+1):length(tmp)], collapse="")</pre>
> names(query) = sub(">","",tmp[tag])
> ## Set parameters for sequence similarity.
> blast <- c("blastp", "10.0", "BLOSUM62", "0", "-1", "-1", "T", "F")
> names(blast) <- c("p","e","M","W","G","E","U","F")</pre>
> match <- c(0.00001, 0.9, 0.9)
> names(match) <- c("e","c","i")</pre>
> ## Install ackages "org.Hs.sp", "org.Hs.ipi".
> if( !require("org.Hs.sp.db") ){
    biocLite("org.Hs.sp.db")
```

```
+ }
> if( !require("org.Hs.ipi.db") ){
+ biocLite("org.Hs.ipi.db")
+ }
> ## Use packages "org.Hs.sp.db", "org.Hs.ipi.db" to produce annotation
> ## R package for query sequence.
> annPkgs = c("org.Hs.sp.db", "org.Hs.ipi.db")
> seqName = c("org.Hs.spSEQ", "org.Hs.ipiSEQ")
> pSeqBuilder_DB(query, annPkgs, seqName, blast, match,
+ prefix="test1", pkgPath, version, author)
```

- 3. After the running of "\*Builder\_DB" function has been finished, a subdirectory named "pkgName" will be produced in given "pkgPath". Then the command "R CMD build" can be used to build source R package, and "R CMD –binary build" can be used to build binary R package for Windows.
- 4. Note:
  - Web connection is needed to download files from public databases, and Perl is needed to parse data files. Additionally, Rtools is needed for Windows user.
  - Users should be aware that downloading, parsing, and saving data may take a long time, in addition to requiring enough disk space to store temporary data files.
  - "R CMD build" and "R CMD -binary build" should be used in command line, not in R. Detailed document about how to create your own packages can be found in the book "Writing R Extensions" (http://cran.r-project.org/doc/manuals/R-exts.pdf). For Windows users, "R CMD build" needs you to have installed the files for building source packages (which is the default), as well as the Windows toolset (see the "R Installation and Administration" manual at http://cran.r-project.org/doc/manuals/R-admin.pdf).

## 5 Session Information
