

Package ‘CNPBayes’

April 11, 2018

Type Package

Title Bayesian mixture models for copy number polymorphisms

Version 1.8.0

Maintainer Jacob Carey <jcarey15@jhu.edu>

Description Bayesian hierarchical mixture models for batch effects and copy number.

Date Tue Jan 20 20:41:00 EST 2015

Author Stephen Cristiano, Robert Scharpf, and Jacob Carey

Depends R (>= 3.4.0), IRanges, GenomicRanges

Imports Rcpp (>= 0.12.1), S4Vectors, matrixStats, RColorBrewer, gtools, combinat, GenomeInfoDb (>= 1.11.6), methods, BiocGenerics, graphics, stats, coda, SummarizedExperiment, mclust, reshape2, ggplot2, magrittr, purrr, tidyr, dplyr, tibble

Suggests testthat, knitr, BiocStyle, rmarkdown, BiocCheck, MASS

Collate 'help.R' 'AllGenerics.R' 'AllClasses.R' 'Deprecated-classes.R' 'RcppExports.R' 'coerce-methods.R' 'copynumber-models.R' 'data.R' 'deprecated_functions.R' 'diagnostics.R' 'functions.R' 'marginal_likelihood.R' 'methods-Hyperparameters.R' 'methods-McmcChains.R' 'methods-McmcParams.R' 'methods-MixtureModel.R' 'methods-MultiBatchModel.R' 'methods-MultiBatchPooled.R' 'methods-SingleBatchModel.R' 'methods-SingleBatchPooled.R' 'methods-SummarizedExperiment.R' 'model_initialization.R' 'plot-functions.R' 'posteriorSimulation-methods.R' 'relabeling.R' 'simulate_data.R'

batch *Retrieve batches from object.*

Description

The batches are represented as a vector of integers.

Usage

```
batch(object)
```

```
## S4 method for signature 'MixtureModel'  
batch(object)
```

Arguments

object see showMethods(batch)

Value

The batch of each data element.

Examples

```
batch(MultiBatchModelExample)
```

BatchModelExample *This data is a simulated example of Batch data*

Description

This data is a simulated example of Batch data

Usage

```
BatchModelExample
```

Value

An example of a 'BatchModel' BatchModelExample

Author(s)

Jacob Carey

bic	<i>Calculate BIC of a model</i>
-----	---------------------------------

Description

Calculate BIC of a model

Usage

```
bic(object)

## S4 method for signature 'BatchModel'
bic(object)

## S4 method for signature 'MultiBatchModel'
bic(object)

## S4 method for signature 'SingleBatchModel'
bic(object)
```

Arguments

object see showMethods(bic)

Value

The BIC of the model.

Examples

```
mb <- MultiBatchModelExample
mcmcParams(mb) <- McmcParams(iter=100, burnin=50)
mb <- posteriorSimulation(mb)
bic(mb)
```

burnin	<i>Number of burnin iterations.</i>
--------	-------------------------------------

Description

This function retrieves the number of burnin simulations to be discarded.

This function changes the number of burnin simulations to be discarded.

Usage

```

burnin(object)

burnin(object) <- value

## S4 method for signature 'McmcParams'
burnin(object)

## S4 replacement method for signature 'McmcParams'
burnin(object) <- value

## S4 method for signature 'MixtureModel'
burnin(object)

## S4 replacement method for signature 'MixtureModel'
burnin(object) <- value

```

Arguments

object	see showMethods(burnin)
value	new number of burnin iterations

Value

The number of burnin simulations.

Examples

```

burnin(SingleBatchModelExample)
mp <- mcmcParams(SingleBatchModelExample)
burnin(mp)

```

chains	<i>Retrieve simulated chains from model object.</i>
--------	---

Description

The method chains applied to a MixtureModel-derived class will return an object of class McmcChains that contains the chains for all simulated parameters. Typically, chains is called in conjunction with an accessor for one of these parameters.

Usage

```

chains(object)

## S4 method for signature 'MixtureModel'
chains(object)

```

Arguments

object	showMethods(chains)
--------	---------------------

Value

The simulated chains.

Examples

```
theta.chain <- theta(chains(SingleBatchModelExample))
dim(theta.chain)
plot.ts(theta.chain, plot.type="single",
        col=seq_len(k(SingleBatchModelExample)))
```

chromosome

Extract character vector of sequence names

Description

Short cut for `as.character(seqnames(g))` where `g` is a `GRanges` object.

Usage

```
chromosome(object, ...)
```

Arguments

<code>object</code>	a <code>GRanges</code> instance
<code>...</code>	currently ignored

Value

A character vector

Examples

```
## Not run:
g <- GRanges("chr1", IRanges(10, 15))
chromosome(g)

## End(Not run)
```

CNPBayes

Bayesian mixture models for copy number estimation

Description

Bayesian mixture models for copy number estimation

collapseBatch	<i>Estimate batch from a collection of chemistry plates or some other variable that captures the time in which the arrays were processed.</i>
---------------	---

Description

In high-throughput assays, low-level summaries of copy number at copy number polymorphic loci (e.g., the mean log R ratio for each sample, or a principal-component derived summary) often differ between groups of samples due to technical sources of variation such as reagents, technician, or laboratory. Technical (as opposed to biological) differences between groups of samples are referred to as batch effects. A useful surrogate for batch is the chemistry plate on which the samples were hybridized. In large studies, a Bayesian hierarchical mixture model with plate-specific means and variances is computationally prohibitive. However, chemistry plates processed at similar times may be qualitatively similar in terms of the distribution of the copy number summary statistic. Further, we have observed that some copy number polymorphic loci exhibit very little evidence of a batch effect, while other loci are more prone to technical variation. We suggest combining plates that are qualitatively similar in terms of the Kolmogorov-Smirnov two-sample test of the distribution and to implement this test independently for each candidate copy number polymorphism identified in a study. The collapseBatch function is a wrapper to the ks.test implemented in the stats package that compares all pairwise combinations of plates. The ks.test is performed recursively on the batch variables defined for a given CNP until no batches can be combined.

Usage

```
collapseBatch(object, plate, THR = 0.1)

## S4 method for signature 'BatchModel'
collapseBatch(object)

## S4 method for signature 'MultiBatchModel'
collapseBatch(object)

## S4 method for signature 'SummarizedExperiment'
collapseBatch(object, plate, THR = 0.1)

## S4 method for signature 'numeric'
collapseBatch(object, plate, THR = 0.1)
```

Arguments

object	see showMethods(collapseBatch)
plate	a vector labelling from which batch each observation came from.
THR	threshold below which the null hypothesis should be rejected and batches are collapsed.

Value

The new batch value.

Examples

```
bt <- collapseBatch(y(MultiBatchModelExample), batch(MultiBatchModelExample))
batches <- as.integer(factor(bt))
model <- MultiBatchModel2(dat=y(MultiBatchModelExample),
                          hp=hpList(k=k(MultiBatchModelExample))["MB"],
                          batches=batches, mp=mcmcParams(MultiBatchModelExample))
```

combinePlates

Combine chemistry plates into batches

Description

In high-throughput assays, low-level summaries of copy number at copy number polymorphic loci (e.g., the mean log R ratio for each sample, or a principal-component derived summary) often differ between groups of samples due to technical sources of variation such as reagents, technician, or laboratory. Technical (as opposed to biological) differences between groups of samples are referred to as batch effects. A useful surrogate for batch is the chemistry plate on which the samples were hybridized. In large studies, a Bayesian hierarchical mixture model with plate-specific means and variances is computationally prohibitive. However, chemistry plates processed at similar times may be qualitatively similar in terms of the distribution of the copy number summary statistic. Further, we have observed that some copy number polymorphic loci exhibit very little evidence of a batch effect, while other loci are more prone to technical variation. We suggest combining plates that are qualitatively similar in terms of the Kolmogorov-Smirnov two-sample test of the distribution and to implement this test independently for each candidate copy number polymorphism identified in a study. The combinePlates function is a wrapper to the ks.test implemented in the stats package that compares all pairwise combinations of plates. The ks.test is performed recursively on the batch variables defined for a given CNP until no batches can be combined.

Usage

```
combinePlates(object, plate, THR = 0.1)

## S4 method for signature 'numeric'
combinePlates(object, plate, THR = 0.1)
```

Arguments

object	see showMethods(combinePlates)
plate	a vector labelling from which batch each observation came from.
THR	threshold below which the null hypothesis should be rejected and batches are collapsed.

Value

The new batch value.

Examples

```
bt <- combinePlates(y(MultiBatchModelExample), batch(MultiBatchModelExample))
batches <- as.integer(factor(bt))
model <- MultiBatchModel2(dat=y(MultiBatchModelExample),
                          hp=hpList(k=k(MultiBatchModelExample))["MB"],
                          batches=batches, mp=mcmcParams(MultiBatchModelExample))
```

 consensusCNP

Identify consensus start and stop coordinates of a copy number polymorphism

Description

The collection of copy number variants (CNVs) identified in a study can be encapsulated in a GRangesList, where each element is a GRanges of the CNVs identified for an individual. (For a study with 1000 subjects, the GRangesList object would have length 1000 if each individual had 1 or more CNVs.) For regions in which CNVs occur in more than 2 percent of study participants, the start and end boundaries of the CNVs may differ because of biological differences in the CNV size as well as due to technical noise of the assay and the uncertainty of the breakpoints identified by a segmentation of the genomic data. Among subjects with a CNV called at a given locus, the consensusCNP function identifies the largest region that is copy number variant in half of these subjects.

Usage

```
consensusCNP(grl, transcripts, min.width = 2000, max.width = 2e+05,
             min.prevalance = 0.02)
```

Arguments

grl	A GRangesList of all CNVs in a study – each element is the collection of CNVs for one individual.
transcripts	a GRanges object containing annotation of genes or transcripts (optional)
min.width	length-one integer vector specifying the minimum width of CNVs
max.width	length-one integer vector specifying the maximum width of CNVs
min.prevalance	a length-one numeric vector specifying the minimum prevalence of a copy number polymorphism. Must be in the interval [0,1]. If less than 0, this function will return all CNV loci regardless of prevalence. If greater than 1, this function will return a length-zero GRanges object

Value

a GRanges object providing the intervals of all identified CNPs above a user-specified prevalence cutoff.

Examples

```

library(GenomicRanges)
##
## Simulate 2 loci at which CNVs are common
##
set.seed(100)
starts <- rpois(1000, 100) + 10e6L
ends <- rpois(1000, 100) + 10.1e6L
cnv1 <- GRanges("chr1", IRanges(starts, ends))
cnv1$id <- paste0("sample", seq_along(cnv1))

starts <- rpois(500, 1000) + 101e6L
ends <- rpois(500, 1000) + 101.4e6L
cnv2 <- GRanges("chr5", IRanges(starts, ends))
cnv2$id <- paste0("sample", seq_along(cnv2))

##
## Simulate a few other CNVs that are less common because they are
## very large, or because they occur in regions that in which copy
## number alterations are not common
##
cnv3 <- GRanges("chr1", IRanges(9e6L, 15e6L), id="sample1400")
starts <- seq(5e6L, 200e6L, 10e6L)
ends <- starts + rpois(length(starts), 25e3L)
cnv4 <- GRanges("chr1", IRanges(starts, ends),
                id=paste0("sample", sample(1000:1500, length(starts))))

all_cnvs <- suppressWarnings(c(cnv1, cnv2, cnv3, cnv4))
gr1 <- split(all_cnvs, all_cnvs$id)
## Not run:
  cnps <- consensusCNP(gr1)
  ##
  ## 2nd CNP is filtered because of its size
  ##
  truth <- GRanges("chr1", IRanges(10000100L, 10100100L))
  seqinfo(truth) <- seqinfo(gr1)
  identical(cnps, truth)

## End(Not run)

##
## Both CNVs identified
##
## Not run:
  cnps <- consensusCNP(gr1, max.width=500e3)

## End(Not run)
truth <- GRanges(c("chr1", "chr5"),
                IRanges(c(10000100L, 101000999L),
                        c(10100100L, 101400999L)))
seqlevels(truth, pruning.mode="coarse") <- seqlevels(gr1)
seqinfo(truth) <- seqinfo(gr1)
## Not run:
  identical(cnps, truth)

```

```
## End(Not run)
```

copyNumber

Extract copy number estimates from a 'CopyNumberModel'

Description

Extract copy number estimates from a 'CopyNumberModel'

Usage

```
copyNumber(object)

## S4 method for signature 'SingleBatchCopyNumber'
copyNumber(object)

## S4 method for signature 'MultiBatchCopyNumber'
copyNumber(object)
```

Arguments

object a SingleBatchCopyNumber or MultiBatchCopyNumber object

See Also

[mapComponents CopyNumberModel](#)

Examples

```
sb <- SingleBatchModelExample
cn.model <- CopyNumberModel(sb)
copyNumber(cn.model)

## here is an identity mapping
mapping(cn.model) <- 1:3
identical(copyNumber(cn.model), z(cn.model))
table(copyNumber(cn.model))

## here, we map the first two mixture components to one copy number state
mapping(cn.model) <- c(1, 1, 2)
table(copyNumber(cn.model))
```

CopyNumberModel	<i>Constructs a CopyNumberModel from SB, SBP, MB, or MBP models</i>
-----------------	---

Description

The mixture components do not necessarily reflect distinct copy number states, possibly due to skewed (non-Gaussian) log R ratios. While easy to fit skewed data with a finite mixture of Gaussians, additional steps are needed to assess whether the components correspond to distinct copy number states. An automated approach for mapping mixture components to copy number states is provided by the `mapComponents` function. The mapping can also be done manually – see `mapping<-`. This accessor `copyNumber` returns the copy number states – i.e., the result after mapping mixture components to copy number states.

Usage

```
CopyNumberModel(model, params = mapParams())

SingleBatchCopyNumber(model)

MultiBatchCopyNumber(model)

MultiBatchCopyNumberPooled(model)

## S4 method for signature 'SingleBatchModel'
CopyNumberModel(model, params = mapParams())

## S4 method for signature 'MultiBatchModel'
CopyNumberModel(model, params = mapParams())

## S4 method for signature 'MultiBatchPooled'
CopyNumberModel(model, params = mapParams())

mapCopyNumber(model, params = mapParams())
```

Arguments

<code>model</code>	a SB, SBP, MB, or MBP model
<code>params</code>	a list of parameters used for mapping mixture components to copy number states.

Value

a `MultiBatchCopyNumber` instance
a `MultiBatchCopyNumber` instance

See Also

[mapComponents copyNumber](#)

Examples

```
sb <- SingleBatchModelExample
cn.model <- CopyNumberModel(sb, mapParams())
```

DensityModel-class *Deprecated classes in CNPBayes*

Description

The following classes in CNPBayes are deprecated and are provided only for compatibility.

Run hierarchical MCMC for batch model.

Run marginal MCMC simulation

Slots

component The component densities.

overall The overall (marginal across batches and components) estimate of the density.

modes A numeric vector providing the estimated modes in the overall density. The modes are defined by a crude estimate of the first derivative of the overall density (see `findModes`).

data A numeric vector containing the data

clusters A vector providing the k-means clustering of the component means using the modes as centers. If an object of class `DensityModel` is instantiated with `merge=FALSE`, this slot takes values 1, ..., K, where K is the number of components.

k An integer value specifying the number of latent classes.

hyperparams An object of class 'Hyperparameters' used to specify the hyperparameters of the model.

theta the means of each component and batch

sigma2 the variances of each component and batch

nu.0 the shape parameter for sigma2

sigma2.0 the rate parameter for sigma2

pi mixture probabilities which are assumed to be the same for all batches

mu overall mean

tau2 overall variance

data the data for the simulation.

data.mean the empirical means of the components

data.prec the empirical precisions

z latent variables

zfreq table of latent variables

probz n x k matrix of probabilities

logprior log likelihood of prior: $\log(p(\sigma_2.0)p(\nu.0)p(\mu))$

loglik log likelihood: $\sum p_k \Phi(\theta_k, \sigma_k)$

mcmc.chains an object of class 'McmcChains' to store MCMC samples

batch a vector of the different batch numbers

`batchElements` a vector labeling from which batch each observation came from
`modes` the values of parameters from the iteration which maximizes log likelihood and log prior
`mcmc.params` An object of class 'McmcParams'
`label_switch` length-one logical vector indicating whether label-switching occurs (possibly an overfit model)
`.internal.constraint` Constraint on parameters. For internal use only.
`k` An integer value specifying the number of latent classes.
`hyperparams` An object of class 'Hyperparameters' used to specify the hyperparameters of the model.
`theta` the means of each component and batch
`sigma2` the variances of each component and batch
`nu.0` the shape parameter for `sigma2`
`sigma2.0` the rate parameter for `sigma2`
`pi` mixture probabilities which are assumed to be the same for all batches
`mu` means from batches, averaged across batches
`tau2` variances from batches, weighted by precisions
`data` the data for the simulation.
`data.mean` the empirical means of the components
`data.prec` the empirical precisions
`z` latent variables
`zfreq` table of latent variables
`probz` $n \times k$ matrix of probabilities
`logprior` log likelihood of prior: $\log(p(\text{sigma2.0})p(\text{nu.0})p(\text{mu}))$
`loglik` log likelihood: $\sum p_k \Phi(\theta_k, \sigma_k)$
`mcmc.chains` an object of class 'McmcChains' to store MCMC samples
`batch` a vector of the different batch numbers
`batchElements` a vector labeling from which batch each observation came from
`modes` the values of parameters from the iteration which maximizes log likelihood and log prior
`label_switch` length-one logical vector indicating whether label-switching occurs (possibly an overfit model)
`mcmc.params` An object of class 'McmcParams'
`.internal.constraint` Constraint on parameters. For internal use only.
`k` An integer value specifying the number of latent classes.
`hyperparams` An object of class 'Hyperparameters' used to specify the hyperparameters of the model.
`theta` the means of each component and batch
`sigma2` the variances of each component and batch
`nu.0` the shape parameter for `sigma2`
`sigma2.0` the rate parameter for `sigma2`
`pi` mixture probabilities which are assumed to be the same for all batches
`mu` means from batches, averaged across batches

tau2 variances from batches, weighted by precisions
 data the data for the simulation.
 data.mean the empirical means of the components
 data.prec the empirical precisions
 z latent variables
 zfreq table of latent variables
 probz n x k matrix of probabilities
 logprior log likelihood of prior: $\log(p(\text{sigma2.0})p(\text{nu.0})p(\text{mu}))$
 loglik log likelihood: $\sum p_k \Phi(\theta_k, \sigma_k)$
 mcmc.chains an object of class 'McmcChains' to store MCMC samples
 batch a vector of the different batch numbers
 batchElements a vector labeling from which batch each observation came from
 modes the values of parameters from the iteration which maximizes log likelihood and log prior
 label_switch length-one logical vector indicating whether label-switching occurs (possibly an overfit model)
 mcmc.params An object of class 'McmcParams'
 .internal.constraint Constraint on parameters. For internal use only.
 k An integer value specifying the number of latent classes.
 hyperparams An object of class 'Hyperparameters' used to specify the hyperparameters of the model.
 theta the means of each component and batch
 sigma2 the variances of each component and batch
 nu.0 the shape parameter for sigma2
 sigma2.0 the rate parameter for sigma2
 pi mixture probabilities which are assumed to be the same for all batches
 mu overall mean
 tau2 overall variance
 data the data for the simulation.
 data.mean the empirical means of the components
 data.prec the empirical precisions
 z latent variables
 zfreq table of latent variables
 probz n x k matrix of probabilities
 logprior log likelihood of prior: $\log(p(\text{sigma2.0})p(\text{nu.0})p(\text{mu}))$
 loglik log likelihood: $\sum p_k \Phi(\theta_k, \sigma_k)$
 mcmc.chains an object of class 'McmcChains' to store MCMC samples
 batch a vector of the different batch numbers
 batchElements a vector labeling from which batch each observation came from
 modes the values of parameters from the iteration which maximizes log likelihood and log prior
 mcmc.params An object of class 'McmcParams'
 label_switch length-one logical vector indicating whether label-switching occurs (possibly an overfit model)
 .internal.constraint Constraint on parameters. For internal use only.

eta.0	<i>Retrieve the rate parameter for the tau2 distribution.</i>
-------	---

Description

Retrieve the rate parameter for the tau2 distribution.

Usage

```
eta.0(object)

## S4 method for signature 'MixtureModel'
eta.0(object)

## S4 method for signature 'Hyperparameters'
eta.0(object)
```

Arguments

object see showMethods(eta.0)

Value

eta.0 of a 'MixtureModel'

Examples

```
eta.0(SingleBatchModelExample)
```

ggChains	<i>Trace plots of MCMC chains and mixture model densities</i>
----------	---

Description

The ggChains method provides a convenient wrapper for plotting the chains of all parameters in the various mixture model implementations. In addition to the estimated number of independent MCMC draws (effective sample size) and Gelman-Rubin convergence diagnostics implemented in gibbs, visualization of the chains is helpful for assessing convergence.

ggplot-style functions for diagnosing convergence

Usage

```
ggChains(model)

ggMixture(model, bins)

ggSingleBatch(model, bins)

ggMultiBatch(model, bins)
```

```

ggSingleBatchChains(model)

## S4 method for signature 'MultiBatchCopyNumber'
ggMixture(model, bins)

## S4 method for signature 'MultiBatchCopyNumberPooled'
ggMixture(model, bins)

## S4 method for signature 'SingleBatchModel'
ggMixture(model, bins)

## S4 method for signature 'MultiBatchModel'
ggMixture(model, bins)

## S4 method for signature 'MultiBatchPooled'
ggMixture(model, bins)

## S4 method for signature 'SingleBatchCopyNumber'
ggMixture(model, bins)

## S4 method for signature 'MultiBatchModel'
ggChains(model)

## S4 method for signature 'MultiBatchPooled'
ggChains(model)

## S4 method for signature 'SingleBatchPooled'
ggChains(model)

## S4 method for signature 'SingleBatchModel'
ggChains(model)

```

Arguments

model	A SB, MB, SBP, or MBP model
bins	a length-one numeric vector indicating the number of bins – passed to <code>geom_hist</code>

Details

The `ggMixture` method overlays the posterior approximation of the Gaussian mixture on the empirical data.

Value

A gg object
 a ggplot object
 a list of ggplot objects. Chains are grouped by the length of the parameter vector. For example, in the single-batch model, the means (`theta`) and variances (`sigma2`) are component-specific (length `k`, where `k` is number of components) and are plotted together in a single ggplot object.

See Also

[gibbs](#)

Examples

```

sb <- SingleBatchModelExample
iter(sb, force=TRUE) <- 1000
burnin(sb) <- 100
sb <- posteriorSimulation(sb)
fig.chains <- ggChains(sb)
## component-specific chains
fig.chains[["comp"]]
## single-parameter chains and log-likelihood
fig.chains[["single"]]

## plot the mixture
fig.mix <- ggMixture(sb)
sb <- SingleBatchModelExample
plist.sb <- ggChains(sb)
## Not run:
## chains for parameter vectors of length k
plist.sb[["comp"]]
## chains for parameters vectors of length 1
plist.sb[["single"]]

## End(Not run)

mb <- MultiBatchModelExample
plist.mb <- ggChains(mb)
## Not run:
## chains for parameters that are batch- and component-specific
plist.mb[["batch"]]
## chains for parameters vectors of length k
plist.mb[["comp"]]
## chains for parameter vectors of length 1
plist.mb[["single"]]

## End(Not run)

```

ggPredictive

Compare the posterior predictive distribution to the empirical data

Description

Compare the posterior predictive distribution to the empirical data

Usage

```
ggPredictive(model, predict, adjust = 1/3)
```

Arguments

model	a SB, MB, SBP, or MBP model
predict	a tibble of the posterior predictive values, batch (only for MB and MBP models), and mixture component assignments
adjust	a length-one numeric vector passed to <code>geom_density</code> – controls the smoothness of the kernel density

Value

a 'gg' object

Examples

```
bmodel <- MultiBatchModelExample
mp <- McmcParams(iter=500, burnin=150, nStarts=4)
mcmcParams(bmodel) <- mp
## Not run:
## this is preferred to posteriorSimulation, but takes longer
bmodel <- gibbs(model="MB", dat=y(bmodel), mp=mp, hp.list=hpList()[["MB"]],
               batches=batch(bmodel))

## End(Not run)
bmodel <- posteriorSimulation(bmodel)
tab <- posteriorPredictive(bmodel)
ggPredictive(bmodel, tab)
```

gibbs	<i>Run a Gibbs sampler on one or multiple types of Bayesian Gaussian mixture models</i>
-------	---

Description

Model types: SB (SingleBatchModel): hierarchical model with mixture component-specific means and variances; MB (MultiBatchModel): hierarchical model with mixture component- and batch-specific means and variances; SBP (SingleBatchPooled): similar to SB model but with a pooled MBP (MultiBatchPooled): similar to MB model but with a pooled estimate of the variance (across mixture components) for each batch.

Usage

```
gibbs(model = c("SB", "MB", "SBP", "MBP"), dat, mp, hp.list, batches,
      k_range = c(1, 4), max_burnin = 32000, top = 2)
```

Arguments

model	a character vector indicating which models to fit (any combination of 'SB', 'MB', 'SBP', and 'MBP')
dat	numeric vector of the summary copy number data for each sample at a single CNP (e.g., the median log R ratio for each sample)
mp	an object of class McmcParams
hp.list	a list of hyperparameters for each of the different models. If missing, this list will be generated automatically with default hyperparameters that work well for copy number data
batches	an integer vector of the same length as dat indicating the batch in which the sample was processed
k_range	a length-two numeric vector providing the minimum and maximum number of components to model. For example, c(1, 3) will fit mixture models with 1, 2, and 3 components.
max_burnin	the maximum number of burnin iterations. See details.
top	a length-one numeric vector indicating how many of the top models to return.

Details

For each model specified, a Gibbs sampler will be initiated
 The number of mixture models fit depends on `k_range` and

Value

A list of models of length `top` sorted by decreasing

See Also

[gelman.diag](#) [effectiveSize](#) [marginalLikelihood](#)

Examples

```
set.seed(100)
nbatch <- 3
k <- 3
means <- matrix(c(-2.1, -2, -1.95, -0.41, -0.4, -0.395, -0.1,
  0, 0.05), nbatch, k, byrow = FALSE)
sds <- matrix(0.15, nbatch, k)
sds[, 1] <- 0.3
N <- 1000
truth <- simulateBatchData(N = N, batch = rep(letters[1:3],
  length.out = N),
  p = c(1/10, 1/5, 1 - 0.1 - 0.2),
  theta = means,
  sds = sds)
```

`gibbs_all`

Evaluate both single-batch and multi-batch models with the specified range for the number of components, returning the top models sorted by marginal likelihood

Description

Evaluate both single-batch and multi-batch models with the specified range for the number of components, returning the top models sorted by marginal likelihood

Usage

```
gibbs_all(hp.list, mp, dat, batches, k_range = c(1, 4), max_burnin = 32000,
  top = 3)
```

Arguments

<code>hp.list</code>	a list of hyperparameters. See example.
<code>mp</code>	a <code>McmcParams</code> object
<code>dat</code>	numeric vector of CNP summary statistics (e.g., median log R ratios)
<code>batches</code>	an integer vector of the same length as the data providing an index for the batch

k_range	a length-two integer vector providing the minimum and maximum number of components
max_burnin	a length-one integer vector indicating the maximum number of burnin iterations
top	the number of models to return after ordering by the marginal likelihood

Value

a list of models

Examples

```

set.seed(100)
nbatch <- 3
k <- 3
means <- matrix(c(-2.1, -2, -1.95, -0.41, -0.4, -0.395, -0.1,
  0, 0.05), nbatch, k, byrow = FALSE)
sds <- matrix(0.15, nbatch, k)
sds[, 1] <- 0.3
N <- 1000
truth <- simulateBatchData(N = N, batch = rep(letters[1:3],
  length.out = N),
  p = c(1/10, 1/5, 1 - 0.1 - 0.2),
  theta = means,
  sds = sds)

models <- gibbs_all(hp.list=hp.list, dat=y(truth),
  batches=batch(truth),
  mp=mp,
  top=3)
## End(Not run)

```

gibbs_pooled

Evaluate both single-batch and multi-batch models with the specified range for the number of components, returning the top models sorted by marginal likelihood

Description

Evaluate both single-batch and multi-batch models with the specified range for the number of components, returning the top models sorted by marginal likelihood

Usage

```
gibbs_pooled(hp.list, mp, dat, batches, k_range = c(1, 4),
             max_burnin = 32000, top = 3)
```

Arguments

<code>hp.list</code>	a list of hyperparameters. See example.
<code>mp</code>	a <code>McmcParams</code> object
<code>dat</code>	numeric vector of CNP summary statistics (e.g., median log R ratios)
<code>batches</code>	an integer vector of the same length as the data providing an index for the batch
<code>k_range</code>	a length-two integer vector providing the minimum and maximum number of components
<code>max_burnin</code>	a length-one integer vector indicating the maximum number of burnin iterations
<code>top</code>	the number of models to return after ordering by the marginal likelihood

Value

a list of models

Examples

```
set.seed(100)
nbatch <- 3
k <- 3
means <- matrix(c(-2.1, -2, -1.95, -0.41, -0.4, -0.395, -0.1,
                 0, 0.05), nbatch, k, byrow = FALSE)
sds <- matrix(0.15, nbatch, k)
sds[, 1] <- 0.3
N <- 1000

## Not run:
models <- gibbs_pooled(hp.list=hp.list, dat=y(truth),
                      batches=batch(truth),
                      mp=mp,
                      top=3)

## End(Not run)

```

Hyperparameters

Create an object of class 'Hyperparameters'

Description

Create an object of class 'Hyperparameters'

The elements of the list are named by the type of model (SB, MB, SBP, MBP).

Usage

```
Hyperparameters(type = "batch", k = 2L, ...)
```

```
hpList(...)
```

Arguments

type	specifies 'marginal' or 'batch'
k	number of components
...	additional arguments passed to hyperparameter constructors

Details

Additional hyperparameters can be passed to the HyperparametersMarginal and HyperparametersBatch models.

Value

An object of class HyperparametersMarginal or HyperparametersBatch
a list of hyperparameter objects

See Also

[HyperparametersMultiBatch](#) [Hyperparameters](#)

Examples

```

hypp <- Hyperparameters("marginal", k=2)
hp.list <- hpList(k=3)
hp.list[["SB"]]

```

Hyperparameters-class *An object to specify the hyperparameters of a model.*

Description

An object to specify the hyperparameters of a model.

Slots

k Number of components
mu.0 Prior mean for mu.
tau2.0 prior variance on mu
eta.0 rate parameter for tau2
m2.0 shape parameter for tau2
alpha mixture probabilities
beta parameter for nu.0 distribution
a shape for sigma2.0
b rate for sigma2.0

HyperparametersBatch-class

An object to specify the hyperparameters of a batch effect model.

Description

This class inherits from the Hyperparameters class. This class is for hyperparameters which are hierarchical over the batches.

Slots

k Number of components
mu.0 Prior mean for mu.
tau2.0 prior variance on mu
eta.0 rate parameter for tau2
m2.0 shape parameter for tau2
alpha mixture probabilities
beta parameter for nu.0 distribution
a shape for sigma2.0
b rate for sigma2.0

HyperparametersMarginal-class

An object to specify the hyperparameters of a marginal model.

Description

This class inherits from the Hyperparameters class. This class is for hyperparameters which are marginal over the batches.

Slots

k Number of components
 mu.0 Prior mean for mu.
 tau2.0 prior variance on mu
 eta.0 rate parameter for tau2
 m2.0 shape parameter for tau2
 alpha mixture probabilities
 beta parameter for nu.0 distribution
 a shape for sigma2.0
 b rate for sigma2.0

HyperparametersMultiBatch

Create an object of class 'HyperparametersMultiBatch' for the batch mixture model

Description

Create an object of class 'HyperparametersMultiBatch' for the batch mixture model

Usage

```
HyperparametersMultiBatch(k = 3L, mu.0 = 0, tau2.0 = 0.4, eta.0 = 32,
  m2.0 = 0.5, alpha, beta = 0.1, a = 1.8, b = 6)
```

Arguments

k	length-one integer vector specifying number of components (typically $1 \leq k \leq 4$)
mu.0	length-one numeric vector of the of the normal prior for the component means.
tau2.0	length-one numeric vector of the variance for the normal prior of the component means
eta.0	length-one numeric vector of the shape parameter for the Inverse Gamma prior of the component variances, tau2_h. The shape parameter is parameterized as $1/2 * \eta.0$. In the batch model, tau2_h describes the inter-batch heterogeneity of means for component h.

m2.0	length-one numeric vector of the rate parameter for the Inverse Gamma prior of the component variances, tau2_h. The rate parameter is parameterized as $1/2 * \text{eta}.0 * \text{m2}.0$. In the batch model, tau2_h describes the inter-batch heterogeneity of means for component h.
alpha	length-k numeric vector of the shape parameters for the dirichlet prior on the mixture probabilities
beta	length-one numeric vector for the parameter of the geometric prior for nu.0 (nu.0 is the shape parameter of the Inverse Gamma sampling distribution for the component-specific variances. Together, nu.0 and sigma2.0 model inter-component heterogeneity in variances.). beta is a probability and must be in the interval [0,1].
a	length-one numeric vector of the shape parameter for the Gamma prior used for sigma2.0 (sigma2.0 is the shape parameter of the Inverse Gamma sampling distribution for the component-specific variances).
b	a length-one numeric vector of the rate parameter for the Gamma prior used for sigma2.0 (sigma2.0 is the rate parameter of the Inverse Gamma sampling distribution for the component-specific variances)

Value

An object of class HyperparametersBatch

See Also

[hpList](#)

Examples

```
HyperparametersMultiBatch(k=3)
```

HyperparametersMultiBatch-class

An object to specify the hyperparameters of a batch effect model.

Description

This class inherits from the Hyperparameters class. This class is for hyperparameters which are hierachical over the batches.

Slots

k Number of components
mu.0 Prior mean for mu.
tau2.0 prior variance on mu
eta.0 rate paramater for tau2
m2.0 shape parameter for tau2
alpha mixture probabilities
beta parameter for nu.0 distribution
a shape for sigma2.0
b rate for sigma2.0

HyperparametersSingleBatch

Create an object of class 'HyperparametersSingleBatch' for the single batch mixture model

Description

Create an object of class 'HyperparametersSingleBatch' for the single batch mixture model

Usage

```
HyperparametersSingleBatch(k = 0L, mu.0 = 0, tau2.0 = 0.4, eta.0 = 32,
  m2.0 = 0.5, alpha, beta = 0.1, a = 1.8, b = 6)
```

Arguments

k	length-one integer vector specifying number of components (typically $1 \leq k \leq 4$)
mu.0	length-one numeric vector of the mean for the normal prior of the component means
tau2.0	length-one numeric vector of the variance for the normal prior of the component means
eta.0	length-one numeric vector of the shape parameter for the Inverse Gamma prior of the component variances. The shape parameter is parameterized as $1/2 * \eta.0$.
m2.0	length-one numeric vector of the rate parameter for the Inverse Gamma prior of the component variances. The rate parameter is parameterized as $1/2 * \eta.0 * m2.0$.
alpha	length-k numeric vector of the shape parameters for the dirichlet prior on the mixture probabilities
beta	length-one numeric vector for the parameter of the geometric prior for nu.0 (nu.0 is the shape parameter of the Inverse Gamma sampling distribution for the component-specific variances). beta is a probability and must be in the interval [0,1].
a	length-one numeric vector of the shape parameter for the Gamma prior used for sigma2.0 (sigma2.0 is the shape parameter of the Inverse Gamma sampling distribution for the component-specific variances)
b	a length-one numeric vector of the rate parameter for the Gamma prior used for sigma2.0 (sigma2.0 is the rate parameter of the Inverse Gamma sampling distribution for the component-specific variances)

Value

An object of class HyperparametersSingleBatch

Examples

```
HyperparametersSingleBatch(k=3)
```

 HyperparametersSingleBatch-class

An object to specify the hyperparameters of a marginal model.

Description

This class inherits from the Hyperparameters class. This class is for hyperparameters which are marginal over the batches.

Slots

k Number of components
 mu.0 Prior mean for mu.
 tau2.0 prior variance on mu
 eta.0 rate parameter for tau2
 m2.0 shape parameter for tau2
 alpha mixture probabilities
 beta parameter for nu.0 distribution
 a shape for sigma2.0
 b rate for sigma2.0

 hyperParams

Accessor for Hyperparameters object for a MixtureModel-derived object

Description

Accessor for Hyperparameters object for a MixtureModel-derived object
 Replace the hyperparameters for a MixtureModel-derived object

Usage

```

hyperParams(object)

hyperParams(object) <- value

## S4 method for signature 'MixtureModel'
hyperParams(object)

## S4 replacement method for signature 'MixtureModel,Hyperparameters'
hyperParams(object) <- value
  
```

Arguments

object see showMethods(hyperParams)
 value an object of class 'Hyperparameters'

Value

The Hyperparameters of a MixtureModel

Examples

```
## Not run:
  hyperParams(SingleBatchModelExample)

## End(Not run)
hypp <- Hyperparameters(type="marginal",
                        k=k(SingleBatchModelExample),
                        alpha=c(9, 9, 10))
hyperParams(SingleBatchModelExample) <- hypp
```

```
iter<- Reset number of iterations.
```

Description

This function changes the number of simulations.

This function retrieves the number of iterations of an MCMC simulation.

Usage

```
iter(object, force = FALSE) <- value

iter(object)

## S4 method for signature 'McmcParams'
iter(object)

## S4 replacement method for signature 'McmcParams'
iter(object, force = FALSE) <- value

## S4 method for signature 'MixtureModel'
iter(object)

## S4 replacement method for signature 'MixtureModel'
iter(object, force = FALSE) <- value
```

Arguments

object	see showMethods(iter)
force	Allow changing of the size of the elements?
value	new number of iterations

Value

The number of MCMC iterations

Examples

```
iter(SingleBatchModelExample)
```

k	<i>Number of components.</i>
---	------------------------------

Description

This function retrieves the number of a priori components.

Updates the number of components and erases chains from a previous posteriorSimulation (if one was performed). Draws from prior to guess new starting values.

Usage

```
k(object)

k(object) <- value

## S4 replacement method for signature 'Hyperparameters'
k(object) <- value

## S4 method for signature 'MixtureModel'
k(object)

## S4 replacement method for signature 'MixtureModel'
k(object) <- value
```

Arguments

object	see showMethods(k)
value	An integer for the new number of components.

Value

The number of components

Examples

```
k(SingleBatchModelExample) <- 2
```

label_switch	<i>Accessor for determining whether label switching occurred during MCMC</i>
--------------	--

Description

Accessor for determining whether label switching occurred during MCMC

Usage

```
label_switch(object)

## S4 method for signature 'MixtureModel'
label_switch(object)
```

Arguments

object MixtureModel-derived class

Examples

```
label_switch(SingleBatchModelExample)
```

logBayesFactor	<i>Compute the log bayes factor between models.</i>
----------------	---

Description

Models of varying component sizes are compared. The log bayes factor is calculated comparing each set of two models by marginal likelihood, as computed by `marginalLikelihood`.

Usage

```
logBayesFactor(x)
```

Arguments

x the result of a call to `computeMarginalLik`.

Value

Log Bayes factor comparing the two models with highest likelihood.

logPrior	<i>Calculate log likelihood of prior for model</i>
----------	--

Description

Calculate log likelihood of prior for model

Usage

```
logPrior(object)

## S4 method for signature 'McmcChains'
logPrior(object)

## S4 method for signature 'MixtureModel'
logPrior(object)
```

Arguments

object see showMethods(logPrior)

Value

log likelihood of the prior.

Examples

```
logPrior(SingleBatchModelExample)
```

log_lik	<i>Retrieve log likelihood.</i>
---------	---------------------------------

Description

Retrieve log likelihood.

Usage

```
log_lik(object)

## S4 method for signature 'McmcChains'
log_lik(object)

## S4 method for signature 'MixtureModel'
log_lik(object)
```

Arguments

object see showMethods(log_lik)

Value

The log likelihood

Examples

```
## retrieve log likelihood at each MCMC iteration
log_lik(chains(SingleBatchModelExample))
## retrieve log likelihood at last MCMC iteration
log_lik(SingleBatchModelExample)
```

m2.0

Retrieve the shape parameter for the tau2 distribution.

Description

Retrieve the shape parameter for the tau2 distribution.

Usage

```
m2.0(object)

## S4 method for signature 'MixtureModel'
m2.0(object)

## S4 method for signature 'Hyperparameters'
m2.0(object)
```

Arguments

object see showMethods(m2.0)

Value

m2.0 for a model

Examples

```
m2.0(SingleBatchModelExample)
```

mapCnProbability	<i>Probabilistic copy number assignments.</i>
------------------	---

Description

Calculate probabilistic copy number assignments using Bayes Rule applied at the MAP estimates of the cluster mean, variance, and class proportion parameters

Usage

```
mapCnProbability(model)
```

Arguments

model	An object of class MixtureModel.
-------	----------------------------------

Value

A matrix of size $N \times K$ where N is number of observations and K is the number of components.

mapComponents	<i>Map mixture components to distinct copy number states</i>
---------------	--

Description

Given two mixture components j and $j + 1$, let N denote the number of subjects with posterior probability of belonging to either component j or $j+1$ is very high (e.g., > 0.99). Let M denote the number of subjects that map to only one of these two components with high probability ($M < N$). If M/N is very small, then the mixture components j and $j+1$ are well separated in terms of the membership probabilities. If M/N is high (say > 0.5), then these components are not well separated and the mixture components are mapped to the same copy number state.

Usage

```
mapComponents(model, params = mapParams())
```

Arguments

model	a SB, MB, SBP, or MBP model
params	a list of mapping parameters

See Also

[CopyNumberModel](#) [mapParams](#)

Examples

```
## Batch model
bmodel <- MultiBatchModelExample
cn.model <- CopyNumberModel(bmodel)
mapping(cn.model)
## Not run:
  ggMixture(cn.model)

## End(Not run)
```

mapParams

Parameters for mapping mixture components to distinct copy number states

Description

Parameters for mapping mixture components to distinct copy number states

Usage

```
mapParams(threshold = 0.1, proportion.subjects = 0.5,
  outlier.variance.ratio = 5, max.homozygous = c(-1.5, -0.5),
  min.foldchange = 1.5)
```

Arguments

- threshold** numeric value in [0, 0.5]. For a given observation (sample), mixture component probabilities > threshold and less than 1-threshold are combined.
- proportion.subjects** numeric value in [0, 1]. Two components are combined if the fraction of subjects with component probabilities in the range [threshold, 1-threshold] exceeds this value.
- outlier.variance.ratio** if the ratio of the component variance to the median variance of the other component exceeds the value of this argument, the component is considered to correspond to outliers.
- max.homozygous** length-2 numeric vector of cutoffs used for establishing a homozygous deletion component. The first element is the cutoff for the mean log R ratios when there are 2 or more states. The second element is the cutoff for the mean log R ratio when there are 3 or more states.
- min.foldchange** a length-one numeric vector. When there are 3 or more states, we compute the ratio of the distance between the means of the sorted components 1 and 2 (the 2 components with lowest means) and the distance between the means of components 2 and 3. If the ratio (i) exceeds the value specified by this parameter, (ii) there are 3 or more states, and (iii) the first component has a mean less than `max_homozygous[2]`, we infer that the first component is a homozygous deletion.

See Also

[mapComponents](#)

Examples

```
mapParams()
```

mapping	<i>Map mixture components to copy number states</i>
---------	---

Description

Map mixture components to copy number states

Usage

```
mapping(object)

mapping(object) <- value

## S4 method for signature 'SingleBatchCopyNumber'
mapping(object)

## S4 method for signature 'MultiBatchCopyNumber'
mapping(object)

## S4 method for signature 'MultiBatchCopyNumberPooled'
mapping(object)

## S4 replacement method for signature 'SingleBatchCopyNumber,numeric'
mapping(object) <- value

## S4 replacement method for signature 'MultiBatchCopyNumber,numeric'
mapping(object) <- value

## S4 replacement method for signature 'MultiBatchCopyNumberPooled,numeric'
mapping(object) <- value
```

Arguments

object	a SB, SBP, MB, or MBP model
value	a k-length numeric vector with values in 1, 2, ..., k, where k is the number of mixture components

See Also

[CopyNumberModel](#)

Examples

```
cn.model <- CopyNumberModel(SingleBatchModelExample)
## manually remap first two components to the same copy number state
mapping(cn.model) <- c(1, 1, 2)
## Not run:
ggMixture(cn.model)

## End(Not run)
```

map_z	<i>Calculate the maximum a posteriori estimate of latent variable assignment.</i>
-------	---

Description

Calculate the maximum a posteriori estimate of latent variable assignment.

Usage

```
map_z(object)
```

Arguments

object an object of class MixtureModel.

Value

map estimate of latent variable assignment for each observation

Examples

```
map_z(SingleBatchModelExample)
```

marginalLikelihood	<i>Compute the marginal likelihood of a converged model.</i>
--------------------	--

Description

Compute the marginal likelihood of a converged model.

Usage

```
marginalLikelihood(model, params = mlParams())

## S4 method for signature 'SingleBatchModel'
marginalLikelihood(model, params = mlParams())

## S4 method for signature 'SingleBatchPooled'
marginalLikelihood(model, params = mlParams())

## S4 method for signature 'MultiBatchModel'
marginalLikelihood(model, params = mlParams())

## S4 method for signature 'MultiBatchPooled'
marginalLikelihood(model, params = mlParams())

## S4 method for signature 'list'
marginalLikelihood(model, params = mlParams(warnings =
  FALSE))
```

Arguments

model	An object of class MarginalModel, or a list of MarginalModel's. Can also be an object of BatchModel or a list of such models.
params	A list containing parameters for marginalLikelihood computation. See mlParams for details.

Value

A vector of the marginal likelihood of the model(s)

See Also

[mlParams](#)

Note: currently thinning of the reduced MCMC chains is not allowed.

Examples

```
## In practice, run a much longer burnin and increase the number of
## iterations to save after burnin
mm <- SingleBatchModelExample
mcmcParams(mm) <- McmcParams(iter=50, burnin=0, nStarts=0)
mm <- posteriorSimulation(mm)
marginalLikelihood(mm)
```

MarginalModelExample *This data is a simulated example of Marginal data*

Description

This data is a simulated example of Marginal data

Usage

```
MarginalModelExample
```

Value

An example of a 'MarginalModel' MarginalModelExample

Author(s)

Jacob Carey

marginal_lik	<i>Accessor for marginal likelihood</i>
--------------	---

Description

Accessor for marginal likelihood

Usage

```
marginal_lik(object)

## S4 method for signature 'MixtureModel'
marginal_lik(object)
```

Arguments

object a SB, SBP, MB, or MBP model

See Also

[marginalLikelihood](#)

Examples

```
sb <- SingleBatchModelExample
marginal_lik(sb)
```

McmcChains-class	<i>An object to hold estimated parameters.</i>
------------------	--

Description

An object of this class holds estimates of each parameter at each iteration of the MCMC simulation.

Slots

theta means of each batch and component
sigma2 variances of each batch and component
pi mixture probabilities
mu overall mean in a marginal. In batch model, averaged across batches
tau2 overall variance in a marginal model. In a batch model, weighted average by precision across batches.
nu.0 shape parameter for sigma.2 distribution
sigma2.0 rate parameter for sigma.2 distribution
logprior log likelihood of prior.
loglik log likelihood.
zfreq table of z.
z latent variables

McmcParams	<i>Create an object of class 'McmcParams' to specify iterations, burnin, etc.</i>
------------	---

Description

Create an object of class 'McmcParams' to specify iterations, burnin, etc.

Usage

```
McmcParams(iter = 1000L, burnin = 0L, thin = 1L, nStarts = 1L,
  param_updates = .param_updates())
```

Arguments

iter	number of iterations
burnin	number of burnin iterations
thin	thinning interval
nStarts	number of chains to run
param_updates	labeled vector specifying whether each parameter is to be updated (1) or not (0).

Value

An object of class 'McmcParams'

Examples

```
mp <- McmcParams(iter=100, burnin=10)
```

mcmcParams	<i>Retrieve MCMC parameters from model.</i>
------------	---

Description

View number of iterations, burnin, etc.

Replace number of iterations, burnin, etc. Any update of the MCMC parameters will trigger an update of the chains. However, if iter (the number of MCMC iterations) is set to a nonpositive value, the chains will not be updated and kept as is.

Usage

```
mcmcParams(object)

mcmcParams(object, force = FALSE) <- value

## S4 method for signature 'MixtureModel'
mcmcParams(object)
```

```
## S4 replacement method for signature 'MixtureModel'
mcmcParams(object, force = TRUE) <- value

## S4 replacement method for signature 'list'
mcmcParams(object, force = TRUE) <- value

## S4 method for signature 'list'
mcmcParams(object)
```

Arguments

object see showMethods(mcmcParams)
force logical value. If false (default) the update will not proceed.
value an object of class 'McmcParams' containing the new number of iterations, etc.

Value

An object of class 'McmcParams'

Examples

```
mcmcParams(SingleBatchModelExample)
```

McmcParams-class	<i>An object to specify MCMC options for a later simulation</i>
------------------	---

Description

An object to specify MCMC options for a later simulation

Slots

thin A one length numeric to specify thinning. A value of n indicates that every nth sample should be saved. Thinning helps to reduce autocorrelation.
iter A one length numeric to specify how many MCMC iterations should be sampled.
burnin A one length numeric to specify burnin. The first \$n\$ samples will be discarded.
nstarts A one length numeric to specify the number of chains in a simulation.
param_updates Indicates whether each parameter should be updated (1) or fixed (0).

Examples

```
McmcParams()
McmcParams(iter=1000)
mp <- McmcParams()
iter(mp)
```

MixtureModel-class *An object for running MCMC simulations.*

Description

BatchModel and MarginalModel both inherit from this class.

Slots

k An integer value specifying the number of latent classes.
hyperparams An object of class 'Hyperparameters' used to specify the hyperparameters of the model.
theta the means of each component and batch
sigma2 the variances of each component and batch
nu.0 the shape parameter for sigma2
sigma2.0 the rate parameter for sigma2
pi mixture probabilities which are assumed to be the same for all batches
mu overall mean
tau2 overall variance
data the data for the simulation.
data.mean the empirical means of the components
data.prec the empirical precisions
z latent variables
zfreq table of latent variables
probz $n \times k$ matrix of probabilities
logprior log likelihood of prior: $\log(p(\text{sigma2.0})p(\text{nu.0})p(\text{mu}))$
loglik log likelihood: $\sum p_k \Phi(\theta_k, \sigma_k)$
mcmc.chains an object of class 'McmcChains' to store MCMC samples
batch an integer-vector numbering the different batches. Must the same length as data.
batchElements a vector labeling from which batch each observation came from
modes the values of parameters from the iteration which maximizes log likelihood and log prior
mcmc.params An object of class 'McmcParams'
label_switch length-one logical indicating problems with label switching
.internal.constraint Constraint on parameters. For internal use only.

mlParams

*Parameters for evaluating marginal likelihood***Description**

Parameters for evaluating marginal likelihood

Usage

```
mlParams(root = 1/10, reject.threshold = exp(-1), prop.threshold = 0.5,
  prop.effective.size = 0.05, ignore.effective.size = FALSE,
  ignore.small.pstar = FALSE, warnings = TRUE)
```

Arguments

<code>root</code>	length-one numeric vector. We exponentiate $p(\theta^* \dots)$ by the value of <code>root</code> . Values less than one reduce the influence of extreme observations.
<code>reject.threshold</code>	length-one numeric vector between 0 and 1. Probabilities in the reduced Gibbs model for the thetas that are less than this threshold are flagged.
<code>prop.threshold</code>	length-one numeric vector between 0 and 1. If more than <code>prop.threshold</code> are flagged, the marginal likelihood is not evaluated.
<code>prop.effective.size</code>	Logical. If the effective size / total iterations is less than <code>prop.effective.size</code> , the marginal likelihood is not evaluated (unless <code>ignore.effective.size</code> is TRUE).
<code>ignore.effective.size</code>	Logical. By default, if the effective size of any theta chain is less than 0.02, the marginal likelihood is not calculated. If this parameter is set to TRUE, the effective size is ignored. Occasionally, the effective size is misleading. See details.
<code>ignore.small.pstar</code>	Logical. Flags from the <code>reject.threshold</code> parameter are ignored and the marginal likelihood is calculated.
<code>warnings</code>	Logical. If FALSE, warnings are not issued. This is FALSE by default for the <code>marginalLikelihood-list</code> method, and TRUE otherwise.

Details

For mixture models, a low effective size of one or more theta chains can occur for the following reasons:

- A. the model has not yet converged
- B. the model is overfit and there is lots of mixing (label swapping)between some of the chains
- C. the model is not overfit but there is a lot of mixing of the thetas

For both (A) and (B) it is desirable to return NAs. While (C) can also occur, it can be easily diagnosed by visual inspection of the chains. To the extent that (C) occurs, the correction factor may not be needed.

Value

a list of parameters to be passed to `marginalLikelihood`.

See Also

[effectiveSize](#) [marginalLikelihood](#)

Examples

```
m1Params()
```

modes

Retrieve the modes from a model.

Description

The iteration which maximizes log likelihood and log prior is found. The estimates for each parameter at this iteration are retrieved.

For a mixture model with K components, there are $K!$ possible modes. One can permute the ordering of the modes and assign the permuted order to a `MixtureModel` derived class by this method.

Usage

```
modes(object)
```

```
modes(object) <- value
```

```
## S4 method for signature 'MixtureModel'
modes(object)
```

```
## S4 replacement method for signature 'MixtureModel'
modes(object) <- value
```

Arguments

`object` a `MixtureModel`-derived class

`value` a list of the modes. See `mode(object)` to obtain the correct format of the list.

Value

A list of the modes of each parameter

Examples

```
modes(SingleBatchModelExample)
```

mu *Retrieve overall mean*

Description

Retrieve overall mean

Usage

```
mu(object)

## S4 method for signature 'MarginalModel'
mu(object)

## S4 method for signature 'McmcChains'
mu(object)

## S4 method for signature 'BatchModel'
mu(object)

## S4 method for signature 'MultiBatchModel'
mu(object)

## S4 method for signature 'SingleBatchModel'
mu(object)
```

Arguments

object see showMethods(mu)

Value

A vector containing 'mu'

Examples

```
mu(SingleBatchModelExample)
```

muc *Retrieve overall mean at each iteration of the MCMC.*

Description

Retrieve overall mean at each iteration of the MCMC.

Usage

```
muc(object)
```

Arguments

object an object of class MarginalModel or BatchModel

Value

A vector of length N or matrix of size N x B, where N is the number of observations and B is the number of unique batches.

Examples

```
muc(SingleBatchModelExample)
```

MultiBatchModel-class *An object for running MCMC simulations.*

Description

Run hierarchical MCMC for batch model.

Slots

k An integer value specifying the number of latent classes.
 hyperparams An object of class 'Hyperparameters' used to specify the hyperparameters of the model.
 theta the means of each component and batch
 sigma2 the variances of each component and batch
 nu.0 the shape parameter for sigma2
 sigma2.0 the rate parameter for sigma2
 pi mixture probabilities which are assumed to be the same for all batches
 mu means from batches, averaged across batches
 tau2 variances from batches, weighted by precisions
 data the data for the simulation.
 data.mean the empirical means of the components
 data.prec the empirical precisions
 z latent variables
 zfreq table of latent variables
 probz n x k matrix of probabilities
 logprior log likelihood of prior: $\log(p(\text{sigma2.0})p(\text{nu.0})p(\text{mu}))$
 loglik log likelihood: $\sum p_k \Phi(\theta_k, \sigma_k)$
 mcmc.chains an object of class 'McmcChains' to store MCMC samples
 batch a vector of the different batch numbers
 batchElements a vector labeling from which batch each observation came from
 modes the values of parameters from the iteration which maximizes log likelihood and log prior
 label_switch length-one logical vector indicating whether label-switching occurs (possibly an overfit model)
 mcmc.params An object of class 'McmcParams'
 .internal.constraint Constraint on parameters. For internal use only.

MultiBatchModel2

*Constructor for MultiBatchModel***Description**

Initializes a MultiBatchModel, a container for storing data, parameters, and MCMC output for mixture models with batch- and component-specific means and variances.

Usage

```
MultiBatchModel2(dat = numeric(), hp = HyperparametersMultiBatch(),
  mp = McmcParams(iter = 1000, thin = 10, burnin = 1000, nStarts = 4),
  batches = integer())
```

Arguments

dat	the data for the simulation.
hp	An object of class 'Hyperparameters' used to specify the hyperparameters of the model.
mp	An object of class 'McmcParams'
batches	an integer-vector of the different batches

Value

An object of class 'MultiBatchModel'

Examples

```
model <- MultiBatchModel2(rnorm(10), batch=rep(1:2, each=5))
set.seed(100)
nbatch <- 3
k <- 3
means <- matrix(c(-2.1, -2, -1.95, -0.41, -0.4, -0.395, -0.1,
  0, 0.05), nbatch, k, byrow = FALSE)
sds <- matrix(0.15, nbatch, k)
sds[, 1] <- 0.3
N <- 1000
truth <- simulateBatchData(N = N, batch = rep(letters[1:3],
  length.out = N),
  p = c(1/10, 1/5, 1 - 0.1 - 0.2),
  theta = means,
  sds = sds)

truth <- simulateBatchData(N = 2500,
  batch = rep(letters[1:3], length.out = 2500),
  theta = means, sds = sds,
  p = c(1/5, 1/3, 1 - 1/3 - 1/5))
MultiBatchModel2(dat=y(truth), batches=batch(truth),
  hp=hpList(k=3)[["MB"]])
```

MultiBatchModelExample

This data is an instance of MultiBatchModel

Description

This data is an instance of MultiBatchModel

Usage

MultiBatchModelExample

Value

An example of a 'MultiBatchModel' MultiBatchModelExample

Author(s)

Jacob Carey

MultiBatchPooledExample

This data is an instance of MultiBatchPooled

Description

This data is an instance of MultiBatchPooled

Usage

MultiBatchPooledExample

Value

An example of a 'MultiBatchPooled' MultiBatchPooledExample

Author(s)

Jacob Carey

muMean	<i>Retrieve overall mean averaged across MCMC simulations.</i>
--------	--

Description

Retrieve overall mean averaged across MCMC simulations.

Usage

```
muMean(object)
```

Arguments

object an object of class MarginalModel or BatchModel

Value

A vector of size 1 or number of batches

Examples

```
muMean(SingleBatchModelExample)
```

names,McmcChains-method	
-------------------------	--

Retrieve the names of the parameters estimated in the MCMC chain.

Description

Retrieve the names of the parameters estimated in the MCMC chain.

Usage

```
## S4 method for signature 'McmcChains'
names(x)
```

Arguments

x an object of class 'McmcChains'

Value

A vector of strings containing the names of each parameter

nStarts	<i>Number of MCMC chains.</i>
---------	-------------------------------

Description

This function retrieves the number of chains used for an MCMC simulation.
 Reset number of starting values

Usage

```
nStarts(object)

nStarts(object) <- value

## S4 method for signature 'McmcParams'
nStarts(object)

## S4 replacement method for signature 'McmcParams'
nStarts(object) <- value

## S4 method for signature 'MixtureModel'
nStarts(object)

## S4 replacement method for signature 'MixtureModel'
nStarts(object) <- value
```

Arguments

object	see showMethods(nStarts)
value	new number of chains

Details

Simulating starting values from the priors makes it imperative to run a large number of simulations for burnin and to carefully evaluate the chains following burning for convergence. The adequacy of the burnin is difficult to assess in high-dimensional settings with a large number of CNPs. To avoid starting in regions of low posterior probability, we use existing EM-based methods in the package {mclust} to select starting values from N bootstrap sample of the observed data, where N is specified as in the example below. For each bootstrap sample, starting values for the model are estimated. For each set of simulated starting values, the log likelihood of the full data is evaluated. The starting values with the largest log likelihood are used as initial values for the MCMC simulations.

Value

An integer of the number of different starts.

Examples

```
number_of_chains <- nStarts(SingleBatchModelExample)
number_of_chains <- 10
nStarts(SingleBatchModelExample) <- number_of_chains
```

nu.0	<i>Retrieve the shape parameter for the sigma.2 distribution.</i>
------	---

Description

Retrieve the shape parameter for the sigma.2 distribution.

Usage

```
nu.0(object)

## S4 method for signature 'McmcChains'
nu.0(object)

## S4 method for signature 'MixtureModel'
nu.0(object)
```

Arguments

object see showMethods(nu.0)

Value

An integer

Examples

```
nu.0(SingleBatchModelExample)
```

numberObs	<i>Number of observations</i>
-----------	-------------------------------

Description

Number of observations

Usage

```
numberObs(model)

## S4 method for signature 'MixtureModel'
numberObs(model)
```

Arguments

model a MixtureModel-derived object

Examples

```
numberObs(SingleBatchModelExample)
```

oned	<i>Retrieve data.</i>
------	-----------------------

Description

Retrieve data.

Usage

```
oned(object)
```

```
## S4 method for signature 'MixtureModel'  
oned(object)
```

Arguments

object see showMethods(oned)

Value

A vector the length of the data

p	<i>Retrieve mixture proportions.</i>
---	--------------------------------------

Description

Retrieve mixture proportions.

Usage

```
p(object)
```

Arguments

object an object of class MarginalModel or BatchModel

Value

A vector of length the number of components

Examples

```
p(MarginalModelExample)
```

pic *Retrieve mixture proportions at each iteration of the MCMC.*

Description

Retrieve mixture proportions at each iteration of the MCMC.

Usage

```
pic(object)
```

Arguments

object an object of class `MarginalModel` or `BatchModel`

Value

A matrix of size MCMC iterations x Number of components

Examples

```
pic(SingleBatchModelExample)
```

posteriorPredictive *Simulate data from the posterior predictive distribution*

Description

Simulating from the posterior predictive distribution can be helpful for assessing the adequacy of the mixture model.

Usage

```
posteriorPredictive(model)
```

Arguments

model a `SingleBatchModel` or `MultiBatchModel`

Examples

```
model <- SingleBatchModelExample
mp <- McmcParams(iter=200, burnin=50)
mcmcParams(model) <- mp
model <- posteriorSimulation(model)
pd <- posteriorPredictive(model)
if(FALSE) qqplot(pd, y(model))

## Not run:
bmodel <- MultiBatchModelExample
```

```

mp <- McmcParams(iter=500, burnin=150, nStarts=20)
mcmcParams(bmodel) <- mp
bmodel <- posteriorSimulation(bmodel)
batchy <- posteriorPredictive(bmodel)

## End(Not run)

```

posteriorSimulation *Run MCMC simulation.*

Description

nStarts chains are run. b burnin iterations are run and then discarded. Next, s iterations are run in each train. The user can also specify an alternative number of components. The mode of the MCMC simulation is also calculated.

Usage

```

posteriorSimulation(object, k)

## S4 method for signature 'MixtureModel,ANY'
posteriorSimulation(object)

```

Arguments

object	see showMethods(posteriorSimulation)
k	The number of a priori components. This is optional and if not specified, the stored k model components are used. This parameters is useful for running multiple models of varying components.

Value

An object of class 'MarginalModel' or 'BatchModel'

See Also

[ggChains](#) for diagnosing convergence. See [ggMixture](#) for plotting the model-based densities.

Examples

```

# Fit model with pre-specified number of components (k=3)
set.seed(123)
## specify small number of iterations so that the example runs quickly
mp <- McmcParams(iter=2, burnin=0, nStarts=3)
sb <- SingleBatchModelExample
mcmcParams(sb) <- mp
posteriorSimulation(sb)

# Run additional iterations, but set nStart = 0 so that the last value of the
# chain is the first value of the next chain
mcmcParams(sb) <- McmcParams(iter=5, nStarts=0, burnin=0)
posteriorSimulation(sb)

```

probCopyNumber	<i>Posterior probabilities for copy number states</i>
----------------	---

Description

In contrast to posterior probabilities for mixture components, this function returns posterior probabilities for distinct copy number states. a `SingleBatchCopyNumber` or `MultiBatchCopyNumber` instance

Usage

```
probCopyNumber(model)

## S4 method for signature 'SingleBatchCopyNumber'
probCopyNumber(model)

## S4 method for signature 'MultiBatchCopyNumber'
probCopyNumber(model)

## S4 method for signature 'MultiBatchCopyNumberPooled'
probCopyNumber(model)
```

Arguments

`model` a SB, SBP, MB, or MBP model

See Also

[CopyNumberModel](#)

probz	<i>Retrieve the probability of latent variable membership by observation.</i>
-------	---

Description

Retrieve the probability of latent variable membership by observation.

Usage

```
probz(object)

## S4 method for signature 'MixtureModel'
probz(object)
```

Arguments

`object` see `showMethods(probz)`

Value

A matrix of size number of observations x number of components

Examples

```
probz(SingleBatchModelExample)
```

qInverseTau2	<i>Quantiles, shape, and rate of the prior for the inverse of tau2 (the precision)</i>
--------------	--

Description

The precision prior for tau2 in the hierarchical model is given by `gamma(shape, rate)`. The shape and rate are a function of the hyperparameters `eta.0` and `m2.0`. Specifically, `shape=1/2*eta.0` and the `rate=1/2*eta.0*m2.0`. Quantiles for this distribution and the shape and rate can be obtained by specifying the hyperparameters `eta.0` and `m2.0`, or alternatively by specifying the desired mean and standard deviation of the precisions.

Usage

```
qInverseTau2(eta.0 = 1800, m2.0 = 100, mn, sd)
```

Arguments

<code>eta.0</code>	hyperparameter for precision
<code>m2.0</code>	hyperparameter for precision
<code>mn</code>	mean of precision
<code>sd</code>	standard deviation of precision

Value

a list with elements 'quantiles', 'eta.0', 'm2.0', 'mean', and 'sd'

Examples

```
results <- qInverseTau2(mn=100, sd=1)
precision.quantiles <- results$quantiles
sd.quantiles <- sqrt(1/precision.quantiles)
results$mean
results$sd
results$eta.0
results$m2.0

results2 <- qInverseTau2(eta.0=1800, m2.0=100)

## Find quantiles from the default set of hyperparameters
hypp <- Hyperparameters(type="batch")
results3 <- qInverseTau2(eta.0(hypp), m2.0(hypp))
default.precision.quantiles <- results3$quantiles
```

saveBatch	<i>Save se data</i>
-----------	---------------------

Description

Batches drawn from the same distribution as identified by Kolmogorov-Smirnov test are combined.

Usage

```
saveBatch(se, batch.file, THR = 0.1)
```

Arguments

se	a SummarizedExperiment object
batch.file	the file name to which to save the data
THR	threshold below which the null hypothesis should be rejected and batches are collapsed.

Value

A vector of collapsed batch labels

sigma	<i>Retrieve standard deviations of each component/batch mean.</i>
-------	---

Description

Retrieve standard deviations of each component/batch mean.

Usage

```
sigma(object)
```

Arguments

object	an object of class MarginalModel or BatchModel
--------	--

Value

A vector of length K, or a matrix of size B x K, where K is the number of components and B is the number of batches

Examples

```
sigma(SingleBatchModelExample)
```

`sigma2`*Retrieve the variances of each component and batch distribution*

Description

For a `MarginalModel`, this function returns a vector of variances. For a `BatchModel`, returns a matrix of size number of batches by number of components.

Usage

```
sigma2(object)

## S4 method for signature 'McmcChains'
sigma2(object)

## S4 method for signature 'MultiBatchModel'
sigma2(object)

## S4 method for signature 'MultiBatchPooled'
sigma2(object)

## S4 method for signature 'MultiBatchCopyNumberPooled'
sigma(object)

## S4 method for signature 'SingleBatchModel'
sigma2(object)
```

Arguments

`object` see `showMethods(sigma2)`

Value

A vector of length number of components or a matrix of size number of batches x number of components

Examples

```
sigma2(SingleBatchModelExample)
```

`sigma2.0`*Retrieve the rate parameter for the sigma.2 distribution.*

Description

Retrieve the rate parameter for the sigma.2 distribution.

Usage

```

sigma2.0(object)

## S4 method for signature 'McmcChains'
sigma2.0(object)

## S4 method for signature 'MixtureModel'
sigma2.0(object)

```

Arguments

object see showMethods(sigma2.0)

Value

A length 1 numeric

Examples

```
sigma2.0(SingleBatchModelExample)
```

sigmac	<i>Retrieve standard deviation of each component/batch mean at each iteration of the MCMC.</i>
--------	--

Description

Retrieve standard deviation of each component/batch mean at each iteration of the MCMC.

Usage

```
sigmac(object)
```

Arguments

object an object of class MarginalModel or BatchModel

Value

A matrix of size N x K where N is the number of observations and K is the number of components

Examples

```
sigmac(SingleBatchModelExample)
```

simulateBatchData *Create simulated batch data for testing.*

Description

Create simulated batch data for testing.

Usage

```
simulateBatchData(N = 2500, p, theta, sds, batch, zz)
```

Arguments

N	number of observations
p	a vector indicating probability of membership to each component
theta	a vector of means, one per component/batch
sds	a vector of standard deviations, one per component/batch
batch	a vector of labels indication from which batch each simulation should come from
zz	a vector indicating latent variable membership. Can be omitted.

Value

An object of class 'MultiBatchModel'

Examples

```
k <- 3
nbatch <- 3
means <- matrix(c(-1.2, -1.0, -0.8,
                 -0.2, 0, 0.2,
                 0.8, 1, 1.2), nbatch, k, byrow=FALSE)
sds <- matrix(0.1, nbatch, k)
N <- 1500
truth <- simulateBatchData(N=N,
                           batch=rep(letters[1:3], length.out=N),
                           theta=means,
                           sds=sds,
                           p=c(1/5, 1/3, 1-1/3-1/5))
```

simulateData *Create simulated data for testing.*

Description

Create simulated data for testing.

Usage

```
simulateData(N, p, theta, sds)
```

Arguments

N	number of observations
p	a vector indicating probability of membership to each component
theta	a vector of means, one per component
sds	a vector of standard deviations, one per component

Value

An object of class 'SingleBatchModel'

Examples

```
truth <- simulateData(N=2500, p=rep(1/3, 3),
                      theta=c(-1, 0, 1),
                      sds=rep(0.1, 3))
```

SingleBatchModel-class

The 'SingleBatchModel' class

Description

Run marginal MCMC simulation

Slots

k An integer value specifying the number of latent classes.

hyperparams An object of class 'Hyperparameters' used to specify the hyperparameters of the model.

theta the means of each component and batch

sigma2 the variances of each component and batch

nu.0 the shape parameter for sigma2

sigma2.0 the rate parameter for sigma2

pi mixture probabilities which are assumed to be the same for all batches

mu overall mean

tau2 overall variance

data the data for the simulation.

data.mean the empirical means of the components

data.prec the empirical precisions

z latent variables

zfreq table of latent variables

probz n x k matrix of probabilities

logprior log likelihood of prior: $\log(p(\text{sigma2.0})p(\text{nu.0})p(\text{mu}))$

loglik log likelihood: $\sum p_k \Phi(\theta_k, \sigma_k)$

mcmc.chains an object of class 'McmcChains' to store MCMC samples

batch a vector of the different batch numbers
 batchElements a vector labeling from which batch each observation came from
 modes the values of parameters from the iteration which maximizes log likelihood and log prior
 mcmc.params An object of class 'McmcParams'
 label_switch length-one logical vector indicating whether label-switching occurs (possibly an overfit model)
 .internal.constraint Constraint on parameters. For internal use only.

SingleBatchModel2 *Constructors for SB and SBP models*

Description

Create objects of class SingleBatchModel or SingleBatchPooled

Usage

```
SingleBatchModel2(dat = numeric(), hp = Hyperparameters(),
  mp = McmcParams(iter = 1000, burnin = 1000, thin = 10, nStarts = 4))
```

```
SingleBatchPooled(dat = numeric(), hp = Hyperparameters(),
  mp = McmcParams(iter = 1000, burnin = 1000, thin = 10, nStarts = 4))
```

Arguments

dat	numeric vector of average log R ratios
hp	an object of class Hyperparameters
mp	an object of class McmcParams

Value

An instance of MultiBatchModel

See Also

[MultiBatchModel2](#)

Examples

```
SingleBatchModel2()
SingleBatchModel2(dat=rnorm(100), hpList(k=2)[["SB"]])
SingleBatchPooled()
```

SingleBatchModelExample

This data is an instance of SingleBatchModel

Description

This data is an instance of SingleBatchModel

Usage

SingleBatchModelExample

Value

An example of a 'SingleBatchModel' SingleBatchModelExample

Author(s)

Jacob Carey

tau

Retrieve overall standard deviation.

Description

Retrieve overall standard deviation.

Usage

tau(object)

Arguments

object an object of class MarginalModel or BatchModel

Value

A vector of standard deviations

Examples

tau(SingleBatchModelExample)

`tau2`*Accessor for the tau2 parameter in the hierarchical mixture model*

Description

The interpretation of `tau2` depends on whether `object` is a `MarginalModel` or a `BatchModel`. For `BatchModel`, `tau2` is a vector with length equal to the number of components. Each element of the `tau2` vector can be interpreted as the within-component variance of the batch means (`theta`). For objects of class `MarginalModel` (assumes no batch effect), `tau2` is a length-one vector that describes the variance of the component means between batches. The hyperparameters of `tau2` are `eta.0` and `m2.0`. See the following examples for setting the hyperparameters, accessing the current value of `tau2` from a `MixtureModel`-derived object, and for plotting the chain of `tau2` values.

Usage

```
tau2(object)

## S4 method for signature 'McmcChains'
tau2(object)

## S4 method for signature 'MultiBatchModel'
tau2(object)

## S4 method for signature 'SingleBatchModel'
tau2(object)
```

Arguments

`object` see `showMethods(tau2)`

Value

A vector of variances

See Also

Hyperparameters

Examples

```
k(MultiBatchModelExample)
tau2(MultiBatchModelExample)
plot.ts(tau2(chains(MultiBatchModelExample)))
```

tau2, MarginalModel-method

DensityModel constructor has been deprecated.

Description

DensityModel constructor has been deprecated.

Instantiates an instance of 'DensityModel' (or 'DensityBatchModel') from a MarginalModel or BatchModel object. See the corresponding class for additional details and examples.

Create an object for running hierarchical MCMC simulations.

DensityModel constructor and methods are Deprecated

Usage

```
## S4 method for signature 'MarginalModel'

```

multiBatchDensities(model)

Arguments

object	see showMethods(DensityModel)
model	MarginalModel
params	list of parameters for computing marginal likelihood
bins	length-one numeric vector specifying number of bins for plotting
merge	Logical. Whether to use kmeans clustering to cluster the component means using the estimated modes from the overall density as the centers for the kmeans function.
x	a DensityModel-derived object, or a MixtureModel-derived object. numeric vector of the one-dimensional summaries for a given copy number polymorphism. If x is a MixtureModel, y is ignored.
y	in memory data
...	additional arguments to HyperparametersBatch
show.batch	a logical. If true, batch specific densities will be plotted.
k	length-one integer vector specifying number of components (typically $1 \leq k \leq 4$)
mu.0	length-one numeric vector of the mean for the normal prior of the component means
tau2.0	length-one numeric vector of the variance for the normal prior of the component means
eta.0	length-one numeric vector of the shape parameter for the Inverse Gamma prior of the component variances. The shape parameter is parameterized as $1/2 * \eta.0$.
m2.0	length-one numeric vector of the rate parameter for the Inverse Gamma prior of the component variances. The rate parameter is parameterized as $1/2 * \eta.0 * m2.0$.
alpha	length-k numeric vector of the shape parameters for the dirichlet prior on the mixture probabilities
beta	length-one numeric vector for the parameter of the geometric prior for nu.0 (nu.0 is the shape parameter of the Inverse Gamma sampling distribution for the component-specific variances). beta is a probability and must be in the interval [0,1].
a	length-one numeric vector of the shape parameter for the Gamma prior used for sigma2.0 (sigma2.0 is the shape parameter of the Inverse Gamma sampling distribution for the component-specific variances)
b	a length-one numeric vector of the rate parameter for the Gamma prior used for sigma2.0 (sigma2.0 is the rate parameter of the Inverse Gamma sampling distribution for the component-specific variances)
data	numeric vector of average log R ratios
batch	a vector of the different batch numbers (must be sorted)
mcmc.params	a McmcParams object
hypp	An object of class 'Hyperparameters' used to specify the hyperparameters of the model.

batch.file	the name of a file containing RDS data to be read in.
plate	a vector containing the labels from which batch each observation came from.
ntiles	number of tiles in a batch
THR	threshold above which to merge batches in Kolmogorov-Smirnov test.
nt	the number of observations per batch
i	integer
j	integer
drop	Not used.

Value

An object of class 'DensityModel'

An object of class HyperparametersBatch

An object of class HyperparametersMarginal

a list. Each element of the list is a BatchModel

An object of class 'BatchModel'

An object of class 'DensityModel'

Tile labels for each observation

Tile labels for each observation

An object of class 'MultiBatchModel'

A plot showing the density estimate

A single proportion for a MarginalModel or a vector of proportions, one for each batch for a BatchModel

An object of class 'BatchModel'

See Also

See [ggSingleBatch](#) and [ggMultiBatch](#) for visualization

[BatchModel](#). For single-batch data, use

[ntile](#)

tauc

Retrieve overall standard deviation at each iteration of the MCMC.

Description

Retrieve overall standard deviation at each iteration of the MCMC.

Usage

tauc(object)

Arguments

object an object of class MarginalModel or BatchModel

Value

A vector of length N or matrix of size N x B, where N is the number of observations and B is the number of unique batches.

Examples

```
tauc(SingleBatchModelExample)
```

tauMean	<i>Retrieve overall standard deviation averaged across MCMC simulations.</i>
---------	--

Description

Retrieve overall standard deviation averaged across MCMC simulations.

Usage

```
tauMean(object)
```

Arguments

object an object of class `MarginalModel` or `BatchModel`

Value

A vector of size 1 or number of batches

Examples

```
tauMean(SingleBatchModelExample)
```

theta	<i>Accessor for the theta parameter in the hierarchical mixture model</i>
-------	---

Description

The interpretation of theta depends on whether object is a `MarginalModel` or a `BatchModel`. For `BatchModel`, theta is a matrix of size B x K, where B is the number of batches and K is the number of components. Each column of the theta matrix can be interpreted as the batch means for a particular component. For objects of class `MarginalModel` (assumes no batch effect), theta is a vector of length K. Each element of theta can be interpreted as the mean for a component. See the following examples for accessing the current value of theta from a `MixtureModel`-derived object, and for plotting the chain of theta values.

Usage

```
theta(object)

## S4 method for signature 'McmcChains'
theta(object)

## S4 method for signature 'MultiBatchModel'
theta(object)

## S4 method for signature 'SingleBatchModel'
theta(object)
```

Arguments

object see showMethods(theta)

Value

A vector of length number of components or a matrix of size number of batches x number of components

Examples

```
## MarginalModel
k(SingleBatchModelExample)
theta(SingleBatchModelExample)
plot.ts(theta(chains(SingleBatchModelExample)))
## BatchModel
k(MultiBatchModelExample)
length(unique(batch(MultiBatchModelExample)))
theta(MultiBatchModelExample)
## Plot means for batches in one component
plot.ts(theta(chains(MultiBatchModelExample))[, 1:3])
```

thin

Get or set the number of thinning intervals.

Description

This function gets or sets the number of thinning intervals used for an MCMC simulation.

Usage

```
thin(object)

thin(object) <- value

## S4 method for signature 'McmcParams'
thin(object)

## S4 method for signature 'MixtureModel'
thin(object)
```

```
## S4 replacement method for signature 'MixtureModel,numeric'
thin(object) <- value
```

Arguments

object	see showMethods(thin)
value	a length-one numeric vector indicating how often to save MCMC iterations to the chain. For example, a thin of 10 means that every 10th MCMC simulation is saved to the chain.

Value

An integer of the number of thinning intervals

Examples

```
thin(SingleBatchModelExample)
thin(SingleBatchModelExample) <- 10L
```

upSample

Create tile labels for each observation

Description

For large datasets (several thousand subjects), the computational burden for fitting Bayesian mixture models can be high. Downsampling can reduce the computational burden with little effect on inference. The function `tileMedians` is useful for putting the median log R ratios for each subject in a bucket. The observations in each bucket are averaged. This is done independently for each batch and the range of median log R ratios within each bucket is guaranteed to be less than 0.05. Note this function requires specification of a batch variable. If the study was small enough such that all the samples were processed in a single batch, then downsampling would not be needed. By summarizing the observations in each bucket by batch, the `SingleBatchModels` (SB or SBP) and `MultiBatchModels` (MB or MBP) will be fit to the same data and are still comparable by marginal likelihoods or Bayes Factors.

Usage

```
upSample(model, tiles)

tileMedians(y, nt, batch)

tileSummaries(tiles)

## S4 method for signature 'MultiBatchModel'
upSample(model, tiles)

## S4 method for signature 'MixtureModel'
upSample(model, tiles)
```

Arguments

model	a SB, MB, SBP, or MBP model
tiles	a tibble as constructed by <code>tileMedians</code>
y	vector containing data
nt	the number of observations per batch
batch	a vector containing the labels from which batch each observation came from.

Value

a SB, MB, SBP, or MBP model
 A tibble with a tile assigned to each log R ratio

See Also

[ntile](#)

Examples

```
mb <- MultiBatchModelExample
tiled.medians <- tileMedians(y(mb), 200, batch(mb))
tile.summaries <- tileSummaries(tiled.medians)
mp <- McmcParams(iter=50, burnin=100)
mb <- MultiBatchModel2(dat=tile.summaries$avgLRR,
                      batches=tile.summaries$batch, mp=mp)
mb <- posteriorSimulation(mb)
ggMixture(mb)
mb2 <- upSample(mb, tiled.medians)
ggMixture(mb2)
```

y

Retrieve data.

Description

Retrieve data.

Usage

```
y(object)

## S4 method for signature 'MixtureModel'
y(object)
```

Arguments

object see `showMethods(y)`

Value

A vector containing the data

Examples

```
y(SingleBatchModelExample)
```

z	<i>Retrieve latent variable assignments.</i>
---	--

Description

Retrieves the simulated latent variable assignments of each observation at each MCMC simulation.

Usage

```
z(object)

## S4 method for signature 'McmcChains'
z(object)

## S4 method for signature 'MixtureModel'
z(object)
```

Arguments

object see showMethods(z)

Value

A vector the length of the data

Examples

```
z(SingleBatchModelExample)
```

zFreq	<i>Calculates a frequency table of latent variable assignments by observation.</i>
-------	--

Description

Calculates a frequency table of latent variable assignments by observation.

Usage

```
zFreq(object)

## S4 method for signature 'McmcChains'
zFreq(object)

## S4 method for signature 'MixtureModel'
zFreq(object)
```

Arguments

object see showMethods(zfreq)

Value

An integer vector of length the number of components

Examples

```
zFreq(SingleBatchModelExample)
```

```
[,McmcChains,ANY,ANY,ANY-method
```

extract estimated parameters at particular iteration of simulation.

Description

extract estimated parameters at particular iteration of simulation.

extract data, latent variable, and batch for given observation

Usage

```
## S4 method for signature 'McmcChains,ANY,ANY,ANY'
x[i, j, ..., drop = FALSE]
```

```
## S4 method for signature 'MultiBatchModel,ANY,ANY,ANY'
x[i, j, ..., drop = FALSE]
```

Arguments

x	An object of class MultiBatchModel, McmcChains, or McmcParams
i	An element of the instance to be extracted.
j	Not used.
...	Not used.
drop	Not used.

Value

An object of class 'McmcChains'

An object of class 'MultiBatchModel'
