# Package 'HIVcDNAvantWout03'

July 11, 2024

July 11, 2024
Version 1.44.0
<b>Date</b> 2005-01-31
<b>Author</b> Dr. Angelique van't Wout, Department of Microbiology, University of Washington
<b>Title</b> T cell line infections with HIV-1 LAI (BRU)
Description The expression levels of approximately 4600 cellular RNA transcripts were assessed in CD4+ T cell lines at different times after infection with HIV-1BRU using DNA microarrays.  This data corresponds to the first block of a 12 block array image (001030_08_1.GEL) in the first data set (2000095918 A) in the first experiment (CEM LAI vs HI-LAI 24hr).  There are two data sets, which are part of a dye-swap experiment with replicates, representing the Cy3 (green) absorption intensities for channel 1 (hiv1raw) and the Cy5 (red) absorption intensities for channel 2 (hiv2raw).

hiv1raw

T cell line infections with HIV-1 LAI (BRU)

## **Description**

The expression levels of approximately 4600 cellular RNA transcripts were assessed in CD4+ T cell lines at different times after infection with HIV-1BRU using DNA microarrays. There are two data sets, which are part of a dye-swap experiment with replicates, representing the Cy3 (green) absorption intensities for channel 1 (hiv1raw) and the Cy5 (red) absorption intensities for channel 2 (hiv2raw).

### Usage

data(hiv1raw)

#### **Format**

This data represents a block within a microarray image with 12x32 spots. It is stored as a vector of length 450,000 representing a 450x1000 matrix (ordered by column) of intensities encoded for compact (16-bit TIFF) storage.

## **Details**

The intensities can be obtained from this data by first subtracting them from 65535, then squaring, then multiplying by a scale factor 4.71542407E-05. In other words, a number x in the hiv1 data set corresponds to intensity  $(256 * 256 - 1 - x)^2 * .0000471542407$ .

#### Source
